The Netherlands

Health care systems

1.20. NETHERLANDS

General context: Expenditure, fiscal sustainability and demographic trends

General country statistics: GDP, GDP per capita; population

GDP per capita (34,380 PPS in 2013) is in The Netherlands well above the EU average (27,881 PPS in 2013), and has increased significantly since 2003, when it was 31,930 PPS. The economy of the Netherlands grew by 2% in 2015. Forward looking indicators suggest that the recovery will continue, with growth forecast at 1.7% in 2016 and 2% in 2017. ⁽²⁰²⁾

Current population stands at 16.8 million people and has been increasing throughout the last decade. According to projections, the increase will continue, reaching 17.1 million in 2060.

Total and public expenditure on health

Total expenditure on health as a percentage of GDP (12.9% in 2013) has significantly increased since 2003, when the share was roughly 10% ⁽²⁰³⁾. This level is also relatively high with respect to the EU-average (10.1% GDP in 2013). The same applies to public expenditure on health as a percentage of GDP, recorded as 10.3%, which is higher than the EU average for the same period (7.8% in 2013). Total (4,492 PPS in 2013) and public (3,336 PPS in 2011) per capita expenditure are also above the EU average (2,988 PPS and 2,218 PPS for the same years, respectively 2013 and 2011).

Expenditure projections and fiscal sustainability

Public expenditure on health care is projected to increase by 1.0 pps of GDP (AWG reference scenario), ⁽²⁰⁴⁾ above the average increase of 0.9 pps for the EU. When taking into account the impact of non-demographic drivers on future spending growth (AWG risk scenario), the increase reaches 1.6 pps of GDP from now till 2060, in line with the EU average of 1.6 pps. The country faces both medium and long term risks

⁽²⁰²⁾ European Commission (2016), European Economic Forecast Spring 2016

⁽²⁰³⁾ This is of course partly a denominator effect because of unfavourable economic conditions.

⁽²⁰⁴⁾ The 2015 Ageing Report: http://europa.eu/epc/pdf/ageing_report_2015_en.pdf.

from a debt sustainability point of view, the latter, driven by the projected dynamics of population ageing and by the unfavourable initial budgetary position. ⁽²⁰⁵⁾

Health status

Whereas life expectancy for women is in line with the average with 83.2 years (83.3 for the EU), men live longer in The Netherlands than in the EU as a whole: 79.5 vs 77.8 in 2013. Notably, healthy life years have decreased for Dutch women, from 64.3 years in 2007, to 57.5 in 2013, which brings the Netherlands under the EU average. However this has methodological reasons ⁽²⁰⁶⁾. For men the picture is slightly better. Years spent in good health are still less than in 2007 (66.1), but are with 61.4 broadly in line with the EU average of 61.6 in 2013. ⁽²⁰⁷⁾

Data show an increase in the proportion of the population which is obese (from 8.4% in 1998 to 11.4% in 2011) although the last few years a stabilisation can be recognised. There has been a steady reduction of the proportion of the population that is a regular smoker, going from 26.7% in 2003 to 18.5% in 2013, under the EU Average (22.0). Alcohol consumption is decreasing too and was in 2012 with 9.1 litres under the EU average (9.8 litre).

System characteristics

System financing

The healthcare system in the Netherlands is insurance based. In 2013, 79.9% of total health expenditure funding was generated from public sources.

⁽²⁰⁵⁾ Fiscal Sustainability Report 2015: http://ec.europa.eu/economy_finance/publications/eeip/pdf/ip018_en.pdf.

⁽²⁰⁶⁾ The definition of Healthy Life Years used in the European Survey on Income and Living Conditions is different than that of Statistics Netherlands (CBS). CBS and the OECD instead show that the percentage of women older than 65 who feel healthy or very healthy is very stable in the Netherlands.

⁽²⁰⁷⁾ Data on life expectancy and healthy life years is from the Eurostat database.

Revenue collection mechanism

Health insurance organisations operating under the health insurance act, have the obligation to accept every citizen requesting a basic health insurance. In addition the insurer is not allowed to request different premiums from different clients. As the cost profiles of the individual insured differ, a system has been set up to compensate insurers for those cost differences (risk equalisation scheme).

The funding of health insurers comes from roughly three different sources. In the first place health insurance organisations collect a nominal premium from each person insured. The level of this premium differs between health insurance organisations depending on the policy of the organisation, their internal organisation, their reserves etc. In addition citizens pay through their employer an insurance premium, based on their income. This contribution is distributed to the different health insurers on the basis of the above described risk equalisation and counts again for roughly 50% of the total revenue of the health insurers). The distribution is based on the risk profile of the population in each health insurance organisation. Indicators such as age, sex, medication use, healthcare use and socio-economic status of the insured play a role in the risk equalisation scheme. A good functioning risk equalisation scheme is vital, to prevent insurers to select citizens with a specific risk profile. The Dutch risk equalisation scheme has both ex ante and ex post risk equalisation mechanism, although ex-post measures are being cancelled. That means that insurers will run a bigger risk, but a lack of ex-post measures forms an incentive for insurers to purchase healthcare more effectively. The third source of funding that insurers receive is a state contribution for the insured under the age of 18 (10% of total revenue). Altogether, nominal premium, deductible and 18- contribution account for the remaining 50%.

Insurers collect insurance premiums and the risk-equalisation scheme between insurers applies to all funds for the basic benefit package. Private and public authorities publish comparative standardised information on premiums, benefits, performance in claim processing and patient satisfaction. The annual switching rate of the insured between funds (the insured can decide before the beginning of each calendar year whether

they want to switch health care insurer) is between 6% and 7%.⁽²⁰⁸⁾ As a general issue characterising patients choosing between alternative providers, information asymmetries, technical complexity and uncertainty as to future needs make switching between funds more difficult. In addition, four insurers account for about 90% of the market. Whether this concentration in the insurance market reduces the expected benefits of competition between insurers is unclear. It may also increase the bargaining power of insurers over care providers and pharmaceutical companies which may lead to cost-savings.

Public (0.35%) and total (0.54%) expenditure on health administration and health insurance as a percentage of GDP are similar to the EU average, though both slightly higher (0.27% and 0.47% respectively in 2013), which is in line with expectations considering the system is based on multiple insurers. The higher than average can be explained by the efforts to supervise costs, prices, quality, contractual terms and market developments in the health market as well as ensuring risk-equalisation and prevent risk-selection, which are necessary in the context of competition in health insurance.⁽²⁰⁹⁾

The current healthcare system is open-ended, although the Cabinet uses annual budget projections for public spending. The most influential decisions are taken at the start of the cabinet; in the (max. 4) years the cabinet is in power, adjustments are made to the path set out at the start. Note, though, that for some treatments the government still defines budgets and for other health care provision the government decides on the remuneration methods for providers or sets prices for treatments. Individual insurers have to determine resource allocation / financing between sectors of care (primary care services, specialists outpatient care, hospitals current spending) and for private hospitals to decide on infrastructure and equipment. Since the healthcare system is open-ended, total health expenditure may exceed the

⁽²⁰⁸⁾ <http://www.vektis.nl/downloads/Publicaties/2016/Zorgthermometer%20nr17/#5/z>.

⁽²⁰⁹⁾ A system based on "regulated" competition inherently needs more regulatory capacity.

budget-projections. ⁽²¹⁰⁾ However, in the recent years expected growth of health expenditure turned out to be lower instead, but according to the Netherlands Bureau for Economic Policy Analysis (CPB) latest projections, health care expenditure is expected to increase over the period 2018-2021. ⁽²¹¹⁾ Possible ways to finance the expected increase of health expenditure are increasing employer taxes and health insurance premiums, or increasing cost-sharing mechanisms or removing increased interventions from the basic benefit package.

Administrative organisation: levels of government, levels and types of social security settings involved, Ministries involved, other institutions

All health insurers are obliged to accept all applicants and to charge each individual applicant the same nominal premium for the same policy. ⁽²¹²⁾ For groups, premium may differ. Applicants are free to choose an insurer. A Health Insurance Income Support scheme provides means-tested subsidies to help those below a certain income threshold (about 70% of the households receive such a subsidy) to pay for their insurance premiums. ⁽²¹³⁾

Coverage (population)

Since 2006, a mandatory universal health insurance scheme operated by private health insurance funds (for profit and not-for-profit) provides 100% population coverage, through contracts with providers.

⁽²¹⁰⁾ According to the OECD, The Netherlands scores 2 out of 6 in the OECD scoreboard due to the not very stringent budget controls.

⁽²¹¹⁾ In these projections, health care expenditure is rising as a percentage of GDP as the projection is based on the long-term trend excluding policy measures and on demographic developments.

⁽²¹²⁾ The voluntary deductible can then influence the price paid for a specific policy, even though the benefits package is the same.

⁽²¹³⁾ The law on the health insurance income support scheme states that no household should pay more on their health care premiums paid to insurers than a fixed percentage of their income. Any costs for health insurance premiums above this percentage are compensated through the health care allowance. In 2011 approximately 70% will receive an allowance.

Treatment options, covered health services

The basic (but comprehensive) insurance package is fixed by law. Health insurers set a nominal community-rated insurance premium corresponding to that package.

Role of private insurance and out of pocket co-payments

In 2013, private health expenditure was about 20.1% of total health expenditure (excluding capital formation), in line with EU average. Out-of-pocket expenditure ⁽²¹⁴⁾ was 5.2% of total current health expenditure in 2014. Out-of-pocket payments apply to certain services but are limited. Eyeglasses, contact lenses and certain dental prostheses, for example, are not covered by mandatory insurance. In 2008, the government introduced an annual mandatory deductible of EUR 150 for insured people 18 and over (which has since been increased to EUR 360 in 2014). GP services are exempted from the mandatory deductible, as a means to encourage primary care services vis-à-vis specialist consultations and hospital care (indeed, to be able to go to a specialist, one needs a referral from the GP). In addition, this exemption is intended not create a financial barrier for individuals to access this type of primary care, thereby supporting the role of the GP as gatekeeper in the Dutch healthcare system. Some services have recently been excluded from the basic package of care, while others have been added. ⁽²¹⁵⁾ About 84% of the population buy supplementary private insurance, though this figure seems to be declining over time. ⁽²¹⁶⁾ It is possible to reinsure the mandatory deductible.

⁽²¹⁴⁾ Note that the EUR 150 mandatory deductible is not included in the 5.7% out-of-pocket-payments. In 2010 the total amount of OOP caused by the mandatory deductible is nearly EUR 1.5 billion. The actual amount of OOP is therefore higher than the 5.7% reported here.

⁽²¹⁵⁾ Some of those removed include examples such as special chairs, allergen-free mattress covers, medication for erectile malfunction, whereas methadone treatment and treatment of dyslexia for children have been added to those included.

⁽²¹⁶⁾

https://www.nza.nl/1048076/1048181/Marktscan_Zorgverzekeringsmarkt_2015.pdf, page 51.

Types of providers, referral systems and patient choice

Provision is mostly private but publicly regulated. Primary care is provided by independent general practitioners (GPs), often working in private group practices. ⁽²¹⁷⁾ Outpatient specialist care is provided in outpatient hospital departments. Almost all hospitals are non-profits while university hospitals are public. Providers have to establish contracts with health insurers.

The number of practising physicians per 100 000 inhabitants (329 in 2013) is below the EU average (3448), showing a consistent increase since 2003 (262). The number of GPs per 100 000 inhabitants (78 in 2013) is in line with the EU average (78.3 in 2013), although it shows a consistent increase (64 in 2003). The number of nurses per 100 000 inhabitants (1,210 in 2013) is above the EU average (837 in 2013) and has increased throughout the decade. This fits with authorities' objective, in recent years, to increase the supply of staff. The numbers above suggest that the skill mix is improving in the direction of a more primary care oriented provision (which the authorities wish to continue to pursue). Staff supply is regulated: there are quotas for medical students and by publicly financed training for medical specialties, although there is no regulation in terms of physician location. Perhaps as a result there is some concentration of medical staff in some regions/areas and staff shortages in others.

Authorities have made strong efforts to use primary care vis-à-vis specialist and hospital care. Residents have to register with a GP and there is a compulsory referral system from primary care to specialist doctors i.e. GPs act like gatekeepers to specialist and hospital care. In addition, GP services are free. Free choice of GP is allowed but given the number of GPs and their capacity constraints, choice may be limited in some areas. Free choice of a specialist or hospital is also allowed. ⁽²¹⁸⁾ Moreover, authorities have planned to introduce preconditions for and stimulate the usage of ICT and e- health solutions to allow for electronic exchange of medical data (e.g. e-prescribing or e-appointments and eHealth

⁽²¹⁷⁾ There are also a not insignificant number of salaried GPs.

⁽²¹⁸⁾ Indeed, according to the OECD, the level of choice of provider in The Netherlands has a score of about 3 out of 6, while gatekeeping scores 6 out of 6.

records), to support and render the referral system and care coordination more effective, reduce medical errors and increase cost-efficiency.

The number of acute care beds per 100.000 inhabitants (334 in 2011) has actually increased over time (from 292 in 2003) remaining below the EU average (360 in 2011). Hospitals have autonomy to recruit medical staff and other health professionals and their remuneration level, although a pay scale is set at national level in a collective labour agreement by employers and trade unions.

Pricing, purchasing and contracting of healthcare services and remuneration mechanisms

GPs are paid a mix of a capitation (EUR 58 per patient minimum, with increments for age and deprivation index) and a consultation fee (EUR 9). ⁽²¹⁹⁾ Specialists are paid either a salary or a fee for service or a mix of the two. GPs are eligible to receive bonuses regarding their activity or performance; these bonuses may relate to all kinds of agreements between the insurer and the GP, e.g. the prescription of generics.

Hospitals are paid by a combination of fixed fees and budgets, set by the Dutch Healthcare Authority (NZa), and by fees negotiated by the hospital and the insurer. A 66%-part of prices was fixed and set by NZa, 34% was set through negotiations between insurers and hospitals. After 2012 however, 70% is set through negotiations between insurers and hospitals. Hospital and mental healthcare fees are based on Diagnosis Treatment Combinations. ⁽²²⁰⁾

When looking at hospital activity, inpatient discharges are lower than the EU average (11.6 vs. 16.3 in 2012) but are more than compensated by a very high number of day case discharges, which are significantly higher than the EU average (13936 vs. 6965 in 2012). The proportion of surgical procedures conducted as day cases (54.6%) is considerably higher than the EU

⁽²¹⁹⁾ Note that there are also salaried GPs, most of them working for another GP.

⁽²²⁰⁾ The OECD score for remuneration incentives to raise the volume of care in The Netherlands is therefore about 3.5 out of 6 as a result of the mix remuneration systems for physicians and hospitals.

average (30.1% in 2012). Hospital average length of stay is in line with the EU average (6.3 days). All these figures point to a high hospital throughput and high hospital efficiency. ⁽²²¹⁾

The market for pharmaceutical products

Since the 1980s, the authorities have implemented a number of policies to control expenditure on pharmaceuticals. Although pricing is free there is a maximum price ⁽²²²⁾ set for each product with a given active substance, strength and formulation which is based on the prices of medicines in four reference countries (BE, DE, UK and FR) the so called external reference pricing, and (since 2004) price negotiations between healthcare insurers, pharmacists and producers. ⁽²²³⁾ Externally dispensed pharmaceutical: the authorities also apply internal reference pricing, ⁽²²⁴⁾ whereby the maximum reimbursement level of a medicine is a weighted average price of the products in each cluster of products that a medicine belongs to, using 1998 prices. New products introduced after 1998 can get a premium price if the manufacturer demonstrates cost-effective added value, and the price of this new product becomes the maximum reimbursement level for all the products that followed and are added to the initial drug to form a cluster. Clusters of pharmaceuticals define "therapeutic equivalents", where pharmaceuticals are equivalent if they have comparable clinical characteristics, a more or less similar indication, route of administration, targeted age group and for which no clinically relevant differences in income apply. For externally dispensed pharmaceutical: only pharmaceuticals included in GVS are covered by basic health insurance - even though reimbursement may sometimes be obtained through complementary voluntary health insurance. ⁽²²⁵⁾

⁽²²¹⁾ Though this may be partly due to the broad coverage for long-term care.

⁽²²²⁾ The system was laid down in the Pricing Act of 1996.

⁽²²³⁾ A maximum price is only set for pharmaceuticals within the GVS. For pharmaceuticals which are used by medical specialists (usually for inpatient care), there is no maximum price.

⁽²²⁴⁾ The reference pricing system, introduced in 1993, is called the Medicine Reimbursement System (GVS).

⁽²²⁵⁾ Note that free choice is not excluded; if patients opt for a more expensive pharmaceutical in the same group, they have to pay the excess themselves, except if the physician decides that the more expensive one is clinically relevant for that particular individual case.

The authorities promote rational prescribing of physicians by stimulating the development of treatment guidelines, set up by medical experts, and the monitoring of prescribing behaviour. They also promote education and information campaigns on the prescription and use of medicines and regional platforms of physicians and pharmacists exist to discuss the use of medicines and improve its effective use. Some insurers have started to offer financial incentives to GPs based on efficient prescription of some drugs. Prescribing is done by active ingredient as part of medical training. A number of insurers initiated a policy of selective contracting of generic medicines; as of the 1st of July 2008, these insurers reimburse only the cheapest generic product (more precisely, those that are at the same price level as the cheapest pharmaceutical plus 5%) within a number of big-selling therapeutic classes. Producers of generics responded by substantially lowering their generic list prices. Insurers and their enrolees benefit from the system, but pharmacists may lose some revenues as a result of diminishing discounts and rebates provided by generic producers. As a result of these policies, the average prices of prescription medication have dropped considerably in the past.

Use of Health Technology Assessments and cost-benefit analysis

The National Institute for Health Research and the Health Care Insurance Board (ZiNL) conduct and gather information on health technology assessment (HTA). Based on this HTA, the ZiNL advises the central government on what should be covered under the basic benefit package of care and the extent of reimbursement /cost-sharing in the system. It is used to determine the reimbursement of medicines and applied to new high-tech equipment, while prices are mainly set by the healthcare authority (NZa). The HTA helps defining clinical guidelines which are compulsory and to meet with effective monitoring of compliance. The ultimate decision on what should, and what should not be covered in the basic package is made by the central government. The central role of specialists in the absorption of treatment into the basic package should not be left unmentioned. New treatments or methods of diagnosis-setting adopted by medical specialists are more or less automatically covered in the basic package, since the basic package covers health care "according to the latest developments in

science and technology". Only after ZiNL research shows that some methods or treatments are (cost-) ineffective the ZiNL may advise that type of treatment to be removed from the basic package.

eHealth (e-prescription, e-medical records)

In the Netherlands, there is no national system for the exchange of data on e-prescription or e-medical records. The exchange of medical data is facilitated mainly on a regional level. Most of the medical records are updated electronically and are no longer available in paper. A survey shows that 93% of general practitioners and 66% of medical specialists update their records mainly or exclusively electronically. Furthermore, many doctors exchange patient data electronically. Nearly all (90%) of the general practitioners exchange patient data electronically with public pharmacies, emergency general practitioner services and hospitals. Almost half (46%) of medical specialists exchange patient data electronically with general practitioners. There are also systems which connect medical specialists or other healthcare providers who are active in the same chain of care (for example cancer or diabetes). Recently national policy has been introduced which states that the majority of chronically ill patients must have access to their own medical data (for example prescribed pharmacy), within the period 2014-2019. With this policy the Dutch government aims for more patient empowerment, higher quality and more effective care.

Health and health-system information and reporting mechanisms:

In order to improve access and reduce the waiting time for hospital surgery, authorities have obliged hospitals and mental healthcare providers to give information to an integrated central and nationwide information system on patients on a waiting list. This information can be used by insurers and their insured to choose between hospitals. The publishing of this information is designed to encourage providers to increase activity and reduce waiting times. Data on patients' experience of care is published by the government, the insurers and NGOs. This improved information transparency has certainly contributed to reduce waiting times and lists, even though the major factor was most

probably the implementation of pay-per-volume systems for most health care providers.

Comprehensive data exists, which enables information on physician and hospital activity and quality and patient care utilisation to be published. This information is used by insurers and patients to choose providers and by providers to improve their own activity. Surveys are conducted on patient's experience and satisfaction with the care provided. A general health care sector performance report is published on a regular basis using a comprehensive set of indicators.

Health promotion and disease prevention policies

The central government has set a number of relevant public health objectives, set in terms of processes and the reduction of health inequalities. The ambition is to decrease or at least stabilise the difference in life expectancy by 2030 compared to now, which, given the expected developments on social determinants of health and the international position of the Netherlands, is an ambitious goal. With regards to healthy life expectancy, the ambition is that of a significant decrease in differences by 2030. Consistently, although the current level is in line with the average (2.6 vs 2.5% for EU in 2013), public expenditure on prevention and public health services as percentage of GDP has been higher than the EU level in the past years (2009 onwards) and, in terms of total expenditure, it still is (3.2% vs 2.5% for EU in 2013).

Recently legislated and/or planned policy reforms

Measures to control health care costs have been implemented by the government since 2008 for acute care. The breach of the Stability and Growth Pact criteria in 2010 reinforced the government's recognition that an effective control of public costs (including health care costs) was needed. The political drive of the current government (in office since 2012) to reduce the national debt to no more than 3% of the national budget has led to significant reductions in the health care budget. The measures that have been implemented can be grouped into four categories:

- (1) Shifting costs from public to private sources;

(2) Shifting costs between various statutory sources (e.g. transfer of care from the exceptional medical expenses act (AWBZ) to the municipalities), mostly in combination with major cuts in the budgets;

(3) Substitution of institutional care with home care and secondary care with primary care; and

(4) Increased focus on improving efficiency and eliminating fraud.

Initially, from 2009, the measures were mainly targeted at reducing overspending, shifting costs from public to private sources by limiting the basic package and efforts to prevent improper health care consumption. From 2011 onwards, the measures focused more on structural changes in the area of acute care, with the government seeking to reach a consensus with stakeholders to agree on further cost containment.

The future policy agenda for the Dutch health system commits itself to the promotion of high quality and sustainable care. In 2011, the first outline agreements between the Minister of Health, health care providers and insurers were concluded, which form a base for less growth of healthcare consumption and more high quality healthcare. These agreements work, because the use of agreements between parties is part of Dutch political culture, and because for providers there is always the latent threat of the government imposing measures, such as tariff cuts, when the agreed terms are not met. Also, the healthcare purchasing market provides sufficient incentives for both insurers and providers to produce healthcare of good quality at acceptable prices.

These objectives, moderate growth and improved quality of care, need to be anchored into the Dutch healthcare system. The following policy objectives will be aimed for in doing so: Primary healthcare (PHC). The Dutch healthcare system is widely known for its well-functioning PHC system. The aim is to further improve coordination between general practitioners, pharmacies, district nurses, and paramedics. Especially the district nurse will become more important; as from 2015 it will be reimbursed by the insurer (without usage will be subject to own risk), with a central role for care in districts. A central role of PHC will also make it possible for healthcare to become more patient-

oriented, as more care can be provided at or near a patient's home.

Regarding innovation, to safeguard high quality care, it is important that innovative new health services will stay available for patients. New and innovative healthcare services will therefore be adopted into the basic package, under strict conditions of proven therapeutic effect and cost-efficiency. Also, innovation raises the voice of patients, by means of increased self-reliance, as well as unburdened healthcare providers. Both aspects, again, make it possible for healthcare to become more patient-oriented.

On transparency, insurers need to know what the outcome of healthcare provision is, as a means of purchasing care based on quality. This also means that they are not obliged to remunerate inefficient healthcare. For the system to work efficiently, it is therefore important that everyone takes up responsibility to solely provide sensible and cost-conscious healthcare. Care provision receipts therefore need to become more understandable for patients and quality of healthcare provision will become more widely available by ZiNL.⁽²²⁶⁾ This will empower patients, and it also provides a base for insurers to select care providers, mainly through selective contracting of healthcare by the insurer. The effect aimed for is that non-sensible use of care will be cut back, while it can also improve safety and, again, patient-oriented healthcare.

Challenges

The analysis above shows that a wide range of reforms have been implemented over the years, to a large extent successfully (e.g. the policies to control pharmaceutical expenditure; to strengthen primary care; to reduce hospital use; to improve data collection and monitoring; and, to improve life-styles), and which The Netherlands should continue to pursue. The challenges for the Dutch health care system are as follows:

⁽²²⁶⁾ Regarding patient information, ZiNL has set up a website support informed patient choice: kiesbeter.nl; furthermore it is also among the responsibilities of the insurer to make quality of care available to their enrollees, in a transparent and comparable manner.

- To continue increasing the efficiency of health care spending in order to adequately respond to the increasing health care expenditure over the coming decades, which is a risk to the medium-term sustainability of public finances.
- To continue to enhance and better distribute primary health care services and basic specialist services to improve equity of access and the effectiveness and efficiency of health care delivery; To ensure an effective referral systems from primary to specialist and hospital care and improving care coordination between types of care, notably by ensuring that users register with their GP and through the development of electronic patient records in the future.
- To find a balance between possible economies of scale and consumer choice between providers and insurers. Possible economies of scale exist in health care provision and insurance; and the challenge is to balance these economies of scale with the need for sufficient user choice between providers/insurers, so that providers/insurers will also in the long-run optimise the mix between quality and costs.
- To ensure that the gains expected to be achieved through competition between insurers as well as providers outweigh the administrative costs associated with the need to monitor and regulate many different dimensions of the health care market.
- To continue to improve accountability and governance of the system and identify possible cost-savings in the health sector administration. To further the existing efforts, such as financial incentives for GPs in smaller areas, to ensure that resource allocation, including that of medical staff, between regions is not detrimental to poorer regions.
- To continue to improve data collection and monitoring of inputs, processes, outputs and outcomes so that regular performance assessment can be conducted and use to continuously improve access, quality and sustainability of care and serve as a tool of patient empowerment.
- To further the efforts to support public health priorities and enhance health promotion and disease prevention activities, i.e. promoting healthy life styles and disease screening given the recent pattern of risk factors (smoking, alcohol) and the pattern of both infectious and non-infectious diseases.

The Netherlands

Long-term care systems

2.20. NETHERLANDS

General context: Expenditure, fiscal sustainability and demographic trends

The Netherlands is the sixth smallest country of the European Union, covering 0.8% of the total surface of the EU, where 3.3% of the total population of the EU resides. The 17 million inhabitants generated in 2013 a GDP of roughly EUR 650 billion or 6.5% of the GDP of the Union as a whole. With a GDP per capita of 34,400 PPS per capita, the Netherlands is also among the five richest Member States. Public expenditure on long-term care was in 2013 with 4.2% of GDP the highest in the EU.

Health status

Life expectancy at birth for both men and women is respectively 79.5 years and 83.2 years, well above the EU average for men and broadly in line for women (77.8 and 83.3 years respectively in 2013). As for the healthy life years at birth however, these are lower than the EU-average for women, with 57.5 years vs EU 61.5, and in line for men, with 61.4 years. At the same time the percentage of the Dutch population having a long-standing illness or health problem is slightly higher than in the Union as a whole (36.2% and 32.5% respectively). The percentage of the population indicating a self-perceived severe limitation in its daily activities is significantly lower than the EU-average (5.7% against 8.7%).

Dependency trends

The amount of people living in the Netherlands depending on others to carry out activities of daily living increases significantly over the coming 50 years. From slightly more than 1.2 million residents living with strong limitations due to health problems in 2013, an increase of 50% is envisaged until 2060 to slightly less than 1.9 million. That is a steeper increase than in the EU as a whole (50% vs 40%). Also as a share of the population, the dependents are becoming a bigger group, from 7.4% to 10.9%, an increase of 47%. This is more than the EU-average increase of 36%.

Expenditure projections and fiscal sustainability

With the demographic changes in the Netherlands, the projected public expenditure on long term care as a percentage of GDP is steadily increasing with

3 percentage points of GDP, from 4.1 percent in 2013 to 7.1 percent in 2060 in the AWG reference scenario. In this scenario, public long-term expenditure is driven by the combination of changes in the population structure and a moderately positive evolution of the health (non-disability) status. The "AWG risk scenario", which in comparison to the "AWG reference scenario" captures the impact of additional cost drivers to demography and health status, i.e. the possible effect of a cost and coverage convergence, projects an increase in spending of 3.5 pps of GDP by 2060. Overall, projected long-term care expenditure increase is expected to add to budgetary pressure. Sustainability risks appear over the long run due to the projected increase in age-related public spending, notably deriving from long-term care, and due to the unfavourable initial budgetary position.⁽⁴²¹⁾

System Characteristics

In the Netherlands, a system of public long-term care insurance had been in place since 1968 until recent years. Everyone who lived in the Netherlands was insured under the AWBZ (Algemene Wet Bijzondere Ziektekosten; Exceptional Medical Expenses Act). The AWBZ covered not only care for the elderly, but in principle all chronic care, especially concerning large expenses where insurance on a private market would not be feasible. This act covered at-home care and care in institutions for the elderly, institutions for the mentally and physically handicapped and institutions for chronic psychiatric patients. Some form of income-dependent cost-sharing existed for practically all LTC services. Moreover, in institutions a contribution had to be paid for the comprehensive package of care and board and lodging. However, the LTC system has recently undergone a major reform with the aim to promote and support independent living. The Exceptional Medical Expenses Act, close to becoming unmanageable due to the breadth of covered services, was repealed. Whereas some of those previously covered under this act are currently covered under the Health Insurance Act, the Social Support Act (Wmo) or the Youth Act, the most vulnerable

⁽⁴²¹⁾ Fiscal Sustainability Report 2015: http://ec.europa.eu/economy_finance/publications/eeip/pdf/ip018_en.pdf.

categories, i.e. those requiring permanent supervision or 24-hour home care, are entitled to care services under the Long-Term Care Act (Wlz).

Administrative organisation

The Exceptional Medical Expenses Act (AWBZ), in place since 1968, used to cover the bulk of expenditures, and was a truly national and largely contribution-based scheme which covered for the costs of personal and nursing care, guidance, accommodation and, on certain conditions, even medical treatment. The basket of covered benefit had grown to such an extent over time that the system was close to becoming unmanageable in the previous setting. In 2007, the provision of home help for domestic activities was delegated to the municipalities as part of a broader decentralising pattern. In 2015, the Exceptional Medical Expenses Act was repealed and was replaced in its scope by other acts like the Social Support Act (Wmo), the Health Insurance Act (Zvw) and Youth Act. Under the Wmo, the local authorities are in charge of provision of care and of the needs assessment, which they formulate based on an interview with the citizen.

The Long-Term Care Act (Wlz), a compulsory health insurance policy based on solidarity, focusses a smaller group of high-need individuals. The amount of the premium is (9.65%) of the income tax, with a ceiling of 33,589 euros. In addition, there is an income-dependent co-payment for adults. This depends on whether the client lives at home or in a care facility, is younger or older than 65, and is single, married or has a domestic partner.

Under the Wlz, 31 regional care offices (zorgkantoren) are in charge to provide care purchased with public funds. The agencies are generally independent subsidiaries of the dominant health insurer in each region. Although they have a contracting budget, these agencies have no funds of their own (except for administrative costs), as care providers are directly paid from a general public fund on the basis of contracts concluded with the agencies. Hence, purchasing agencies bear no financial risk on purchasing care. All contributions collected under Wlz are deposited into the Long-Term Care Fund, which is managed by the National Healthcare Institute. The central

government tops up the fund using public funds if these funds are too low. Although the care costs are paid from the Wlz fund, the care offices are charged with keeping costs within the national and regional budget and with purchasing care as efficiently as possible. In addition, the purchasing agencies can set quality standards and check services invoiced by the healthcare providers match the required standards. All long term care tariffs are regulated by the Dutch Healthcare Authority (NZa). The NZa set maximum prices, where under bargaining between purchasing agencies and providers is allowed.

Types of care

The main recipients of LTC include persons with learning, physical or sensory disabilities, elderly persons and persons with psychiatric disorders. The Long-Term Care Act (Wlz) covers the most vulnerable categories, i.e. those requiring permanent supervision or 24-hour care nearby, providing a broadly defined set of services including residential care. The Wmo covers a broad package of services, such as personal care, nursing and domiciliary care for individuals that need assistance but are not as severe cases. All these services (including treatment and stay in an institution) were previously delivered under AWBZ.

Most clients apply for care-in-kind, but since the mid-1990s they may also opt for a personal budget to purchase health services privately (under both Wlz and Wmo). The cost explosion of the personal budget scheme from 413 million euro in 2002 to 2.2 billion in 2010 highlights the popularity of this scheme. However, experts worry that it did not equally lower the demand for in-kind care and also tends to crowd out informal care.

In providing support under the Social Support Act, the local authorities distinguish between general provisions and personalised provisions. General provisions are designed for the community and cover a range of services from recreational activities to transportation. Personalised provisions are designed for a single person; this might include domestic assistance and support. Currently, the assistance is aimed at being able to live independently (for example, help with organising the household or with administration).

To facilitate the elderly living at home (as opposed to living in a rest home or care institution), the government encourages municipalities, social housing associations and care institutions to build homes adapted to the needs of older people. Accessible local care also plays a part in helping the elderly to be independent for as long as possible. In order to achieve this, a new focus has been placed on creating local health care networks where general practitioners, nurses and other care givers cooperate in offering custom care to patients.

Eligibility criteria

Patients' eligibility for Wlz care is assessed by an independent Care Assessment Centre (CIZ). There are no financial incentives for CIZ: its financial position is not affected by its decisions. CIZ's task is to carry out independent, objective and integral assessments. The procedure is the same for care reimbursed in cash and for in-kind care. CIZ adopts certain standards to determine different 'profiles' (packages), in which the eligibility is determined on the needs and characteristics of the client.

The centre decides if patients are eligible for Wlz care and how much care they are entitled to. Once assessed, patients can opt either to receive in-kind care (either in an institution or at home) or a cash benefit ("personal budget") that is roughly equivalent to 100% of the care related costs of in-kind care. The cash-reimbursement option is not commonly used for treatment and stay in an institution, except for some small-scale initiatives. For most of the budget, patients are obliged to be able to show that they did spend the money on care. Out of the 2016 budget of 19.9 billion, 1.3 billion is the amount attributed to the personal budget. Based on these figures, cash benefits amount to roughly 6,5% of total expenditure for Wlz. ⁽⁴²²⁾

Clients who prefer in-kind care have some say with regard to which care organisation delivers their care, however, the responsibility for

organising and purchasing this care remains with the 'zorgkantoren' (regional care offices).

Under the Wmo, the local authorities are in charge of delivery and discuss the client's request for support together with the client. It is then up to the local authority to provide the appropriate type of support and determine how this support is to be organised. People can either contact the local authority or be referred by a GP. A meeting is set-up to assess the request for support, in light of factors such as the possibility of the individual to draw on their personal network or on a general provision. Hence the local authority decides whether to accept or reject a request of support, which, if granted, can materialise into services of a personal budget with or without a co-payment. As for the financing, the local authorities receive funds from the central government through the Municipal Fund, which they can allocate to services discretionally. They then pay providers for services or transfer funds to the Social Insurance Bank for personal healthcare budgets.

Co-payments, out of the pocket expenses and private insurance

The long-term care system is funded by social security premiums, taxes and co-payments. Since co-payments are income- and wealth-dependent, care users will not run into severe financial difficulties. But it is quite well possible that persons in institutions have to contribute so much that they just have 'a clothing allowance and pocket money' left to spend according to their own preferences. At the same time, the income-related co-payment covers only a small portion of the total costs of long-term care (10% of total for Wlz in 2015).

Role of the private sector

Institutional care providers must be non-for-profit organisations, while the home care market has been opened to for-profit companies.

Formal/informal caregiving

Since its inception in 1968, the Exceptional Medical Expenses Act has been expanded and improved. However, long-term care has also changed in its nature and extent through a whole range of supplementary regulations. This has led to

⁽⁴²²⁾

<https://www.rijksoverheid.nl/onderwerpen/prinsjesdag/documenten/begrotingen/2015/09/15/xvi-volksgezondheid-welzijn-en-sport-rijksbegroting-2016>, p 138.

an increased demand for care, rising costs and a sizeable bureaucracy. Moreover, it has led to a system that is aimed too much at the provision of care (by institutions) and which is based too little on the client. In some cases, the appeal for Exceptional Medical Expenses Act care has increased needlessly. This neither benefits our society, nor the clients themselves. There is also the threat of a shortage of care workers. In 2010 there were 1.3 million employees in the care and welfare sector. According to prognoses from the National Institute of Public Health and Environmental Protection (Rijksinstituut voor Volksgezondheid en Milieuhygiëne or RIVM), over the coming 15 to 20 years at least 400,000 extra care providers will be needed in the care sector alone, if the policy remains unchanged. At the same time, the working population will decline during the coming decades. To respond to this future challenge, the Netherlands has carried out projections of future needs for carers, and is implementing a reorganisation of the labour force (including financial support for institutions) in long term care. Nonetheless, given the size of the challenge, this area deserves regular monitoring. During the last few years there have been several reports published in which the conclusion is put forward that measures were needed in order to allow the Exceptional Medical Expenses Act to take future developments into account. Besides these reports, analyses have also been compiled within the care sector itself by organisations such as ActiZ (organisation for care providers in the Netherlands) as well as a collaboration of client organisations, which show that the Exceptional Medical Expenses Act does not make sufficient use of the strengths of the people involved and those around them.

Recently legislated and/or planned policy reforms

The main objective of the recent reform of LTC was to guarantee its financial sustainability in future. As such, substantial cuts were made in the system, including the delisting of day care and personal counselling under the Awbz, the closure of residential care for persons with severity-package 1-3 and a substantial reduction of the state budget for municipalities to carry out the Wmo.

The reform of LTC includes a radical revision of the institutional structure. The most important

changes are: (a) decentralisation of non-residential (extramural) long-term care to municipalities under the new Wmo, (b) the abolishment of the Awbz and the simultaneous introduction of the Long-term Care Act (*Wlz: Wet Langdurige Zorg*) to cover care for the most vulnerable and (c) the transfer of personal care from the Awbz to the Health Insurance Act. In addition, municipalities are attributed the responsibility for most ⁽⁴²³⁾ of the youth care as established by the new Youth Law approved in 2014. The reform of LTC has not only institutional and budgetary implications but also a *normative* component consisting of three main elements emphasising the importance of individual responsibility, encouraging and promoting independent whenever possible.

The first significant step was the introduction of the Wmo in 2007, a key element of which was the decentralisation of large parts of LTC from the AWBZ to municipalities, which became responsible for household services. Under the arrangement municipalities must give support to people who cannot run a household on their own and participate in social life. Each municipality has discretionary power as regards need assessment, which may lead to unequal access.

Later on, *some non-residential (extramural) services in LTC* were transferred to municipalities (and insurers), and, together with a 40% cut in the budget for household services, a revision of the Wmo along the following lines was adopted:

- the Wmo stresses individual and social responsibility;
- municipalities are responsible for the implementation of the Wmo;
- the municipalities deliver tailor-made services (*maatwerk*) based on a need assessment procedure (*keuken-tafelgesprek*);
- the municipalities decide on whether to assign a personal budget;
- means-testing is forbidden, but municipalities can set co-payments.

⁽⁴²³⁾Some aspects of youth care are regulated under Zvw or Wlz.

Wlz⁽⁴²⁴⁾ is set up as a social health insurance scheme based on income contributions and covering the entire population, who has a right to long-term care subject to need. As for the range of benefits, the Wlz covers either services in-kind or a personal budget or a total package at home (*volledig pakket thuis*). The system of severity-adjusted packages (*zorgzwaartepakketten*) remains in place. The new Wlz has many features in common with the former Awbz. For instance, the care offices have been preserved and are in charge of contracting LTC providers, the system of regional budgets is still in place and the Nza sets maximum tariffs.

Challenges

The Netherlands has undergone a major reform of the LTC system to tackle the high projected costs of its long-term care system while preserving quality. As it stands, the main challenges of the system appear to be:

- **Supporting family carers:** to further the efforts in establishing policies for supporting informal carers, such as through flexible working conditions, respite care, carer's allowances replacing lost wages or covering expenses incurred due to caring, cash benefits paid to the care recipients, while ensuring that incentives for employment of carers are not diminished and women are not encouraged to withdraw from the labour market for caring reasons.
- **Ensuring availability of formal carers:** further the efforts in determining current and future needs for qualified human resources and facilities for long-term care, with a focus on ensuring their future availability.
- **Ensuring coordination and continuity of care:** to establish better co-ordination of care pathways and along the care continuum, such as through a single point of access to information, the allocation of care co-ordination responsibilities to providers or to care managers, via dedicated governance structures for care co-ordination and the integration of health and care to facilitate care co-ordination.
- **Improving value for money:** to invest in assistive devices, which for example, facilitate self-care, patient centeredness, and co-ordination between health and care services; to invest in ICT as an important source of information, care management and coordination, to encourage competition across LTC providers to stimulate productivity enhancements.
- **Prevention: to promote healthy ageing and preventing physical and mental deterioration of people with chronic care;** to employ prevention and health-promotion policies and identify risk groups and detect morbidity patterns earlier
- **Improving administrative efficiency**
- **Improving the governance framework:** to ensure a coherent and integrated legal and governance framework for a clear delineation of responsibilities of state authorities concerning the provision of long-term care services; to share data within government administrations to facilitate the management of potential interactions between LTC financing, targeted personal-income tax measures and transfers (e.g. pensions), and existing social-assistance or housing subsidy programmes; to deal with cost-shifting incentives across health and care.
- **Improving financing arrangements:** to consider reviewing the extent of user cost-sharing on LTC benefits or to consider pre-funding elements, which implies setting aside some funds to pay for future obligations.
- **Support independent living:** to provide effective home care, tele-care and information to recipients, as well as improving home and general living environment design.

⁽⁴²⁴⁾ It covers groups of people that need constant assistance due to the nature of the condition or to the risk that the condition would worsen with lack of support and supervision.
