Directorate-General for Economic and Financial Affairs

The Joint Harmonised EU Programme of Business and Consumer Surveys

User Guide

updated in January 2024

1. INTRODUCTION

Business and consumer surveys provide essential information for economic surveillance, short-term forecasting and economic research. Moreover, they are widely used to detect turning points in the economic cycle. Surveys are therefore a key complement to official statistics, which are often available after long delays. The survey data generated within the framework of the Joint Harmonised EU Programme of Business and Consumer Surveys are particularly useful for monitoring economic developments at Member State, EU and euro-area level. High frequency, timeliness and continuous harmonisation are among their main qualities.

The Commission's harmonised survey programme, managed by the Directorate-General for Economic and Financial Affairs (DG ECFIN), was set up in 1961, and its scope has since expanded considerably in terms of both countries and sectors covered. The data published every month by DG ECFIN are derived from surveys conducted by national institutes in the Member States and the candidate countries. With these data, DG ECFIN builds composite indicators to track cyclical movements in a specific sector or in the economy as a whole. The survey results are then used by DG ECFIN for economic analysis, surveillance and short-term forecasting. Outside the Commission, the ECB, central banks, research institutes and financial institutions frequently use the EU survey data for both qualitative and quantitative analysis.

The aim of this User Manual is to provide detailed information on the Commission's survey programme. It includes a thorough description of the harmonised surveys and of the method used by the Commission to process survey results, and informs on when and where the results are published.

The Manual is structured as follows. Chapter 2 gives an overview of the survey programme and of the common features of the harmonised surveys. Chapter 3 explains how the survey results are collected and processed, while Chapter 4 describes how they are disseminated and published.

2. GENERAL PRINCIPLES UNDERLYING THE HARMONISED BUSINESS AND CONSUMER SURVEYS

2.1. Overview of the harmonised survey programme

Past and future developments in the survey programme

The Joint Harmonised EU Programme of Business and Consumer Surveys (hereafter referred to as the BCS programme) was launched by the Commission decision of 15 November 1961.¹ The first survey was the harmonised business survey in the manufacturing industry conducted in 1962. Since then, the sector coverage of the programme has widened considerably. The BCS programme was extended to the construction sector and to investment plans in the manufacturing sector in 1966, to consumers in 1972, to the retail trade in 1984, and to the services sector in 1996.² In 2021, the investment survey was reformulated in qualitative terms and added to the industry and services surveys.

¹ The BCS programme is implemented by DG ECFIN pursuant to the Commission's institutional prerogatives. The programme was initiated by a Commission decision in November 1961 and was modified through subsequent Council and Commission decisions. It was last approved through Commission decision C(97) 2241 of 15 July 1997. Regular updates on the implementation of the Programme in terms of use, methodology and coverage were presented in Commission communications COM(2000) 770 of 29 November 2000, COM(2006) 379 of 12 July 2006, SEC(2012) 227 of 4 April 2012 and C(2016) 6634 of 20 October 2016.

² From April 2007 to March 2023, the Commission conducted a separate survey in the financial services sector. The objective of the survey was to achieve representative results for the EU and the euro area as a whole, but not necessarily

Meanwhile, the geographical coverage of the programme has been regularly extended to include new Member States as well as new candidate countries. The programme currently covers all 27 EU Member States and all five EU candidate countries (i.e. Montenegro, North Macedonia, Albania, Serbia and Türkiye). The integration of the candidate countries into the programme at an early stage is necessary in order to provide reliable and comparable data to follow their economic situation, and to guarantee the production of accurate EU aggregates once these countries become members of the EU.

Harmonisation and Commission financial support

The harmonised surveys are carried out at national level by partner institutes such as ministries, statistical offices, central banks, research institutes, business associations or private companies. The surveys are conducted according to a common methodology, which consists essentially of harmonised questionnaires and a common timetable (see Section 2.2).

The institutes are selected by the Commission through a call for proposals. The Commission supports their activity with action grants, which are limited to a maximum of 50% of the total costs of the surveys. These grants are designed to cover the costs associated with the adoption of the harmonised methodology. As the Commission's financial support takes the form of grants, the data collected remain the property of the institutes, but the Commission acquires a parallel right of free use of the data. In contrast, when the national institutes have no clear interest or purpose in conducting a particular type of survey, the Commission concludes a service contract with the selected institute. In such cases, the Commission covers the full cost of the survey and has the copyright of the data.

Survey frequency and sample size

Five surveys are currently conducted on a monthly basis in the following areas: manufacturing industry,³ construction, consumers, retail trade, and services. Some additional questions are asked on a quarterly basis in the surveys in industry, construction, services and among consumers. Twice a year, extra questions on companies' investment plans are added to the industry and services surveys.

for each individual Member State. The survey was conducted in twelve Member States: Belgium, Czech Republic, Germany, Ireland, Spain, France, Italy, Luxembourg, the Netherlands, Austria, Poland, and Sweden, but results were published for the EU and EA only.

³ In the rest of the publication, this survey is referred to as the industry survey.

Notes: ":" = not available/applicable. In the case of the consumer survey, the reported sample size generally corresponds to the effective sample (response target).

Source: European Commission services

The *sample size* for each survey varies across countries according to the heterogeneity of their economies, and is generally positively related to their respective population size (Table 2.1). About 134 000 firms and some 32 000 consumers are currently surveyed every month across the EU. The nominal sample includes some 38 000 units that are surveyed every month in the industry survey, 47 000 in the services survey, 28 000 in the retail trade survey and 22 000 in the construction survey. It has to be noted that the reported figures for the business surveys are nominal in the sense that they are generally affected by non-response.) The effective sample sizes, i.e. the numbers of actually conducted interviews/filled-in questionnaires, are usually about 30% lower. The effective samples at the EU (euro area) level are thus around 30 000 (19 000) for industry, 32 000 (17 000) for services, 21 000 (10 000) for retail trade and 16 000 (8 000) for construction. For details at the country level, see the metadata sheets available at [metadata-partner-institutes](#).

Balances and composite indicators

Answers obtained from the surveys are aggregated in the form of “balances”. Balances are constructed as the difference between the percentages of respondents giving positive and negative replies. The Commission calculates EU and euro-area aggregates on the basis of the national results and seasonally adjusts the balance series.

The balance series are then used to build composite indicators. First, for each surveyed sector, the Commission calculates confidence indicators as arithmetic means of answers (seasonally adjusted balances) to a selection of questions closely related to the reference variable they are supposed to track (e.g. industrial production for the industrial confidence indicator). These indicators thus provide information on economic developments in the different sectors. Second, the results for the five surveyed sectors are aggregated into the Economic Sentiment Indicator, whose purpose is to track GDP growth at Member State, EU and euro-area level. Third, the Commission produces an Employment Expectations Indicator, which summarises managers’ employment plans in the four surveyed business sectors (industry, services, retail trade, construction) and thus provides a timely indication of changes in total employment. Furthermore, the EU BCS Programme features an Economic Uncertainty Indicator which synthesises the answers of business managers/consumers to a question asking them how difficult it is to make predictions about their future business/financial situation. Finally, the programme also features a Labour Hoarding Indicator, which reports the (weighted) percentage of firms which expect (i) their output to decrease, but (ii) their employment to increase or remain unchanged. The indicator is available for all four surveyed business sectors, as well as the economy as a whole, both at country and aggregate EU/EA level.

The calculation of balances and composite indicators is described in detail in Chapter 3.

2.2. Common properties of the surveys

Harmonisation

The principle of harmonisation underlying the Commission’s survey programme aims to produce a set of comparable data for all countries. Harmonisation is essential to allow the comparison of business cycles in the different Member States as well as the calculation of meaningful business cycle indices for the euro area and the EU as a whole.

To achieve comparability between countries, the BCS programme is governed by two basic principles:

- use by all national institutes of the same harmonised questionnaires; and
- conduct of the national surveys, and transmission of the results, according to a common timetable.

Harmonisation does not mean uniformity. The national questionnaires may include additional questions, beyond the harmonised ones. Similarly, the sectoral breakdown in the questionnaires may be more

detailed than the one set in the programme. Also, the national partner institutes are free to organise the fieldwork the way that best suits the purpose. While the sample design, the sample size, the survey mode, and other methodological considerations are in principle left to their discretion, these important parameters shall be chosen so as to ensure a high degree of representativeness and a low degree of irregular short-term fluctuations (noise) in the data. A broad and frequently updated sampling frame and a high number of completed questionnaires are considered as key in this respect. The survey methodology of the national institutes is scrutinised in the evaluation stage of the Commission's calls for proposals. Institutes are encouraged to follow the list of best practice for the conduct of business and consumer surveys developed by the Commission.⁴

The Commission plays a leading role in the evolution of the common methodology of the BCS programme. It organises an annual workshop with all participating institutes in order to discuss harmonisation issues, such as changes in the questionnaires and developments in the survey programme. The Commission also organises every two years a joint meeting with the OECD with a view to examining methodological issues of common interest to both EU and non-EU countries.

Representative sample

The participating institutes should ensure that the samples chosen for each survey are representative of the sector. The sample size must be large enough to provide reliable data. This issue is discussed in more detail in Section 3.1.

Timetable

The *timing* is common to all the harmonised surveys. Fieldwork for the monthly surveys is generally performed in the first two to three weeks of each month and the quarterly surveys are carried out in the first two to three weeks of the first month of each quarter (January, April, July and October). Likewise, the questions that are asked only on a quarterly basis are included in the questionnaires in January, April, July and October. The semi-annual questions on investment in the industry and services surveys are carried out in March/April and in October/November, and the results are sent to the Commission together with the April and November results. The business survey results are sent to the Commission at least five working days before the end of the reference month and in accordance with a predefined format. The deadline for the delivery of consumer survey results is generally seven working days before the end of the month.

Questionnaires

One essential feature of the BCS programme is the use by participating institutes of harmonised questionnaires. The standard questionnaires are given in Annex 2. In practice, the questionnaires used by the institutes may differ slightly from the harmonised ones, either due to the inclusion of additional questions or as a result of a different wording of the questions in the national language, required for strictly idiomatic reasons. In this regard, it is imperative to retain the meaning of the original question in English. Other differences in the questionnaires (e.g. use of different concepts, different reference periods, different answering categories, etc.) must be avoided in order to ensure comparability of survey results across countries. Finally, the questionnaires can occasionally include additional pilot questions, whose results are not necessarily made public.

⁴ The list is available at [best-practices](#) . It builds on and incorporates the earlier 'International guidelines on data collection and survey design' developed by the Commission and the OECD in cooperation with national survey institutes. These guidelines, together with general methodological considerations, can be found in the European Commission special report No 5/2006 on the Joint Harmonised EU Programme of Business and Consumer Surveys, available at: [ee_bcs_2006_05_en](#).

Monthly business and consumer surveys

The harmonised surveys provide information on a wide range of variables that are useful to monitor cyclical developments. Table 2.2 presents the list of variables covered in the business and consumer surveys. As mentioned previously, most of the questions are asked on a monthly basis, but a few additional questions are added every quarter to the surveys in industry, construction and among consumers, and twice a year in industry and services. Nearly all the questions are of a qualitative nature. In May 2021, a new uncertainty question was added to the survey programme asking business managers/consumers to indicate how difficult it is to make predictions about their future business/financial situation.

The *industry survey* is largely qualitative. The main questions refer to an assessment of recent trends in production, of the current levels of order books and stocks, as well as expectations about production, selling prices and employment. In addition, the survey provides on a quarterly basis quantitative information on two variables that are not reported in conventional statistics, namely capacity utilisation and the number of months of production assured. Since 2021, investment plans are investigated in qualitative terms twice a year.

In view of the scarcity of national account data on building activity, *construction surveys* are an important source of information concerning short-term developments in this sector. The construction survey provides qualitative information, with the exception of one quantitative question on the number of months of production secured.

The information provided by the *retail trade survey* is entirely qualitative. Managers are asked about their assessment of recent developments in their business situation, of the current level of stocks, and their expectations about a number of economic variables (production, new orders, employment and prices charged).

The purpose of the *consumer survey* is twofold: first, to collect information on households' spending and savings intentions, and second, to assess their perception of the factors influencing these decisions. To this end, the questions are organised around four topics: the households' financial situation, the general economic situation, savings and intentions with regard to major purchases. The consumer survey is mainly qualitative. Since 2003, two quantitative questions are asked concerning perceived and expected price changes.

The monthly *services survey* provides information about managers' assessment of their recent business situation, of the past and future changes in their company's turnover and employment and of their expected selling prices. All the replies are qualitative. In terms of quarterly questions, managers are asked about the main factors currently limiting their business. Since 2011, they are also asked if the volume of activity could be increased with present resources and, if so, by how much. The latter question is used to calculate a measure of capacity utilisation in the services sector. Since 2021, investment plans are investigated twice a year.

All the monthly surveys have a similar *answer scheme*. For qualitative questions, answers are usually given according to a three-option ordinal scale: "increase" (+), "remain unchanged" (=), "decrease" (-); or "more than sufficient" (+), "sufficient" (=), "not sufficient" (-); or "too large" (+), "adequate" (=), "too small" (-). In some cases, respondents have the choice between four, five or six options. In the consumer survey, respondents can usually choose among six options: "got/get a lot better" (++), "got/get a little better" (+), "stayed/stay the same" (=), "got/get a little worse" (-), "got/get a lot worse" (--), don't know (N).

Table 2.2: Variables covered in the monthly business and consumer surveys

Type of survey	Monthly questions	Quarterly questions
Industry	Production, past 3 months Production, next 3 months Predictability of future business situation Total order books Export order books Stocks of finished products Selling prices, next 3 months Firm's employment, next 3 months	Factors limiting production Production capacity, current Months of production secured Order books, past 3 months Export order books, next 3 months Capacity utilisation Competitive position, domestic market Competitive position, EU markets Competitive position, extra-EU markets
Construction	Building activity, past 3 months Factors limiting building activity Overall order books Firm's employment, next 3 months Predictability of future business situation Selling prices, next 3 months	Months of production secured
Retail trade	Business activity, past 3 months Business activity, next 3 months Predictability of future business situation Stocks of goods Orders placed with suppliers, next 3 months Firm's employment, next 3 months Selling prices, next 3 months	
Services	Business situation, past 3 months Demand/Turnover, past 3 months Demand/Turnover, next 3 months Predictability of future business situation Firm's employment, past 3 months Firm's employment, next 3 months Selling prices, next 3 months	Factors limiting business Potential increase in volume of activity
Consumers	Financial situation, past 12 months Financial situation, next 12 months Predictability of future financial situation General economic situation, past 12 months General economic situation, next 12 months Consumer prices, past 12 months (qualitative and quantitative change) Consumer prices, next 12 months (qualitative and quantitative change) Unemployment, next 12 months Major purchases of durable consumer goods, current environment Major purchases intentions, next 12 months Savings, current environment Savings intentions, next 12 months Capacity to save	Purchase of a car, next 12 months Purchase of a house, next 12 months Home improvements, next 12 months

Source: European Commission services

The answer scheme is different for quantitative questions. These are the questions about capacity utilisation, months of production assured, potential increase in the volume of activity and consumer price inflation. Here, answers are requested in percentage of full capacity, in number of months or in percentage, respectively.

For questions on factors limiting production, a list of possible factors is proposed, and respondents are requested to select one or several factors (yes/no answer).

Investment survey

The investment survey is carried out twice a year – in March/April (“spring survey”) and in October/November (“autumn survey”) – among companies in the manufacturing industry and in services (the latter starting in October/November 2021). The survey is carried out as part of the industry and services surveys, using the same panel of companies.

Table 2.3: Variables covered in the half-yearly investment survey and answer scheme

Survey	Variable	Answer scheme
March/April survey:		
	Change in investment from year t-2 to year t-1	(+), (=), (-)
	Change in investment from year t-1 from year t	(+), (=), (-)
October/November survey:		
	Change in investment from year t-1 to year t	(+), (=), (-)
	Change in investment from year t to year t+1	(+), (=), (-)
	Type(s) of investment planned for years t and t+1 (replacement/extension of production capacity/ technical progress/other)	yes/no
	Factors stimulating investment for years t and t+1 (demand/financial resources/technical factors/ other factors):	yes/no

Note: (+) = increase, (=) = remain unchanged, (-) = decrease.

Source: European Commission services

The spring and autumn surveys have different questionnaires (Table 2.3; for the complete questionnaires, see Annex 2.). In spring, managers are asked about change in investment of their company from year t-2 to year t-1 and from year t-1 to t (total and breakdowns: machinery and equipment; land, building and infrastructure; intangibles (R&D, software, data, intellectual property, vocational training, etc.). In autumn, they are asked about the change in total investment of their company from year t-1 to year t and from year t to t+1. The autumn survey also contains a question on the type of investment (replacement, extension of production capacity, technical progress, other) planned in years t and t+1, as well as a question on the factors driving investment (demand, profitability, technical factors, others) planned in years t and t+1.

Classifications

For the business surveys (industry, retail trade, construction, services and investment), survey results are broken down by branches according to the Classification of economic activities in the European Community (NACE rev. 2), at the two-digit level.⁵ The classifications can be found in Annex A.2. The change in the identification and grouping of similar economic activities associated with the move to NACE rev.2 in May 2010 implied a statistical break in the time series, particularly at the branch level.⁶ The services survey raises specific issues in terms of sector coverage (see Box 2.2).

For the consumer survey, respondents are categorised according to five criteria: income, occupation, education, age and sex. The definitions of the different categories are given in Annex 2.2.3.

⁵ NACE rev.2 became compulsory for all statistics classified according to economic activities produced by the Commission or Member States (EC Regulation No 1893/2006).

⁶ For further information on this, see [NACE classification](#).

Box 2.2: Sector coverage of the services survey

The sector coverage of the services survey varies across countries. In principle, the BCS Programme requires information on 37 branches, i.e. divisions (two-digit level) from the NACE Rev. 2 classification. These divisions cover the sections H to N and R to S of NACE Rev. 2. Trade (section G) and public services (sections O to Q) are thus deliberately excluded. The 37 branches/divisions of interest in the services survey can be classified into three groups in terms of country coverage:

- A first group consists of divisions 49 (land transport and transport via pipelines), 52 (warehousing and support activities for transportation), 55 (accommodation), 56 (food and beverage service activities), 58 (publishing activities), 61 (telecommunications), 62 (computer programming, consultancy and related activities), 68 (real estate activities), 69 (legal and accounting activities), 70 (activities of head offices; management consultancy activities), 71 (architectural and engineering activities; technical testing and analysis), 73 (advertising and market research), 74 (other professional, scientific and technical activities), 77 (rental and leasing activities), 78 (employment activities), 79 (travel agency, tour operator reservation service and related activities), 81 (services to buildings and landscape activities) and 82 (office administrative, office support and other business support activities); this group is covered by virtually all Member States. In terms of value added, this group represents nearly 70% of the required services activities (as described above) in the EU.
- A second group consists of divisions 50-51 (water and air transport), 53 (postal and courier activities), 59 (video and music activities), 60 (programming and broadcasting activities), 63 (information service activities), 72 (scientific research and development), 80 (security and investigation activities), 92 (gambling and betting activities), 93 (sports, amusement and recreation activities), 95 (repair of computers and personal and household goods) and 96 (other personal service activities); a significant number (between 6 and 11) of institutes do not include results for these branches. In terms of value added, this group represents about 10% of the required EU services activities.
- A third group consists of divisions 64-66 (financial services), 75 (veterinary activities), 90-91 (cultural activities) and 94 (activities of membership organisations); for this group, a majority of surveys includes no information. In terms of value added, this group represents close to 20% of the required services activities. It has to be noted that around 80% of this concerns financial services activities which are covered by the dedicated financial services survey.

In theory, the sector coverage of a survey should be as wide as possible. However, services being a very heterogeneous sector, some branches might show a very idiosyncratic pattern in terms of business cycle behaviour. In particular, this may be the case for public and semi-public services (e.g. healthcare, cultural activities) and also, to some extent, for financial services. For the sake of sector homogeneity, it might, therefore, be appropriate not to aggregate these branches with the rest of the services sector. Furthermore, in order to ensure cross-country comparability of surveys, the branches covered by national surveys should coincide or overlap to the maximum. In this regard, the situation is continuously improving as several participating institutes are extending the sector coverage of their services surveys.

3. COLLECTING AND PROCESSING BUSINESS AND CONSUMER SURVEYS

3.1. Sampling

The survey samples are derived from a frame, which is supposed to register all the units of the whole population under question. The frame can be created from official or statistical registers, or from membership lists of business associations and chambers of commerce. Taking into account the various changes that might occur in the population (mergers, bankruptcies, starting of new firms, etc.), a regular update of the frame is imperative in order to keep it representative. Good coverage of the frame is indeed very important to secure the quality of the surveys.

The coverage rate of the sample, generally measured via turnover or employment, indicates at which percentage rate the sample represents the frame. The sample size needs to be sufficiently large to give estimates of the balances and other items of interest which are reliable enough to meet users' requirements. The appropriate sample size therefore depends on the level of precision required by users and is determined mainly by the variance of the individual responses. Given that large countries tend to show larger structural heterogeneity than very small countries, the sample size tends to be positively related to the size of the economy.

The participation of managers and consumers in the surveys is voluntary in most countries.⁷ Naturally, some are unable or unwilling to respond. Non-response is a problem, in particular if the potential responses from the non-respondents would have deviated systematically from those who did respond. This would introduce a bias, i.e. the answers would no longer be representative of the population, which preferably should be corrected for. A high response rate, i.e. the degree to which managers or consumers answer the questionnaires, is therefore crucial for the quality and the reliability of the results.

In practice, a trade-off typically emerges between the desired precision and the required cost of a survey. In general, there are three methods of data collection such that the information collected can be used to draw inferences about the population. First, one can collect data from all units in the population. This is a costly and lengthy procedure unless the population is small. Second, one can collect data from a sample of units that have been selected from the population with the intention that they should be representative of that population. A sample of this kind is called a purposive sample. In order to draw inferences about the population using a purposive sample, a number of assumptions have to be made about the representativeness of the surveyed units. In general, there are limitations to the inferences that can be drawn from purposive samples when the probability of selection is not known. Third, data can be collected from a random sample of units which have been selected with known probabilities of selection from the population. In this case, no assumptions about the representativeness of the data collected are needed. Moreover, there are well-known techniques for determining the precision of estimated totals and averages.

In order to make a random sample more efficient (a smaller sample for a given level of precision), many institutes use some form of stratified random sampling that involves the separation of the population into non-overlapping sub-populations, called strata, which have similar variance with regard to the key variables covered in the survey. Stratification is applied according to different criteria. The stratification criteria used for business surveys are mainly firm size and activity sector. For consumer surveys, the sex, age, education, income and occupation of the person are commonly used for the selection of the respondents.⁸

For business surveys, the sample does not differ much from one period to another. In most cases, a panel of companies is established and surveyed each month. This approach is motivated by the structure of the production system itself, which does not change significantly from one period to another and is also often highly concentrated. It is then essential to question the dominant companies in each branch. There are a number of advantages to be gained from always questioning the same firms: notably, replies are received more quickly, and the variability of results between two successive surveys is also reduced, having a positive effect on the required sample size. It is therefore recommended that the same panel is maintained over time for business surveys and that it is updated at regular intervals, or that a smaller part of the sample is replaced each period (rotating panels).

⁷ Participation is, however, compulsory in Spain, France, Italy, Luxembourg, the Netherlands, Poland and Portugal for some or all surveys.

⁸ The consumer surveys are in some countries carried out by so-called quota sampling. This sampling technique means that respondents (consumers) are searched for until a certain, predetermined, quota of respondents is reached. A shortcoming of this sampling method is that, since the sample is not random, no inference regarding the population can be drawn.

3.2. Aggregation and weighting

Starting from each stratum, the percentages of answers to each reply option are calculated. Two alternatives are available at this stage: a simple counting of the answers or a weighted counting. In the first case, the numbers of positive and negative replies are counted, and then expressed as percentages of the total number of firms in the stratum. In the second case, a weighting coefficient is used for each firm representing an aspect of its size (for example, in terms of turnover, employment or production). The weighting scheme aims to improve the comparability of the survey responses and reference series, rather than having an *a priori* idea that larger firms judge or predict better.

Whether weighted or not, the outcome for each stratum h , for each variable X , for a given month t , is a column vector

$X_h = (P_h, E_h, M_h)$ where P_h is the share reporting an increase, E_h is the share reporting no change, and M_h is the share reporting a decrease.

Having obtained the results for each stratum, the overall results are calculated as weighted averages of the results by strata. Weighting coefficients used at this stage reflect the relative significance of each stratum in the frame or population and are often derived from official statistics, such as the value added of a specific sector as a share of that of the total industry in question. The weighting in this case is used to improve the quality of the sample, by correcting any possible discrepancies of representation. Total results for each variable are then a vector

$$X = (\sum P_h \cdot w_h, \sum E_h \cdot w_h, \sum M_h \cdot w_h)$$

where w_h are the relative weighting coefficients for each stratum and $\sum w_h = 1$. Note also that, by construction, $\sum P_h \cdot w_h + \sum E_h \cdot w_h + \sum M_h \cdot w_h = 100$.

When business survey results are aggregated to higher levels, for instance at the European level, a weighted average of country results is obtained by applying relevant country weights (see Section 3.4).

3.3. Calculation of balances

On the basis of the distribution of the various options for each question, aggregate balances are calculated for each question. Balances are the difference between positive and negative answering options, measured as percentage points of total answers. In particular, if a question has three alternative options, “positive” (“up”, “more”, “more than sufficient”, “good”, “too large”, “increase”, “improve”, etc.), “neutral” (“unchanged”, “as much”, “sufficient”, “satisfactory”, “adequate”, etc.) and “negative” (“down”, “less”, “not sufficient”, “too small”, “decline”, etc.), and if P, E and M (with P+E+M=100) denote the percentages of respondents having chosen respectively the option positive, neutral, and negative, the balance is calculated as

$$B = P - M$$

In the case of questions with six options, i.e. the three options above plus “very positive” (“got/get a lot better”, “very much higher”, “increase sharply”, etc.), “very negative” (“got/get a lot worse”, “very unfavourable”, “fall sharply”, etc.) and “don’t know”, the balances are calculated on the basis of weighted averages. If P, E and M have the same meaning as in the previous paragraph, while PP denotes the percentage of respondents having chosen the option “very positive”, MM the percentage of respondents having chosen the option “very negative” and N is the percentage of respondents without any opinion (so that PP+P+E+M+MM+N=100), balances are calculated as

$$B = (PP + \frac{1}{2}P) - (\frac{1}{2}M + MM)$$

In the special case of the uncertainty questions enquiring the predictability of the future situation with the four answer options PP, P, M, MM, the shares of positive answers are subtracted from the negative ones, rather than vice versa. This ensures that the resulting uncertainty series have an intuitive interpretation, with higher values signalling higher uncertainty. The balance is calculated as

$$B = (MM + \frac{1}{2}M) - (\frac{1}{2}P + PP)$$

It is clear from the expressions above that balance values range from -100 , when all respondents choose the negative option (or the most negative one in the case of five-option questions) to $+100$, when all respondents choose the positive (or the most positive) option.

When reporting the survey results, the Commission uses mainly balance statistics. There are, however, other ways of quantifying the results, such as the diffusion index (DI). This is defined as $DI = P + \frac{1}{2} E$ under the restriction that $P + E + N = 100$. Moreover, there are more complex quantification methods which are based on distributional assumptions⁹. In order to allow analysts and researchers to quantify the survey results using other methods than the balance statistic, detailed results by answer categories are available on DG ECFIN's website at: [Detailed data by answer category](#).

3.4. Calculating EU and euro-area aggregates

One important task of the Commission services (DG ECFIN) is the production of aggregate survey results for the EU and the euro area on the basis of the results received from the Member States. EU and euro-area aggregate replies to the questionnaires are calculated as weighted averages of the country-aggregate replies. The weights are the shares of each of the Member States in an EU (euro-area) reference series, and are smoothed by calculating a two-year moving average. The weights are usually updated every year in January. The reference series are extracted from AMECO and for the most recent period, where yearly reference series are not available, the Commission forecast is used.¹⁰

Table 3.1 summarises relevant information concerning the reference series used to compute the country weights.¹¹

⁹ For a critical review of the different quantification methods see Nardo M. (2003), "The Quantification of Qualitative Survey Data: A Critical Assessment", *Journal of Economic Surveys*, Volume 17, Issue 5, pages 645–668, December 2003.

¹⁰ For the weights currently used, see [Time series - European Commission \(europa.eu\)](#).

¹¹ These are the weights used to aggregate the total sector results. At sub-sector level, weights based on short-term-statistics (STS) are used for the business surveys.

Table 3.1: Reference series (Eurostat database) used to compute the country weights

Survey	Reference series	Eurostat code
Industry	Gross value added at constant prices, industry excluding construction	nama_10_a64 - National Accounts aggregates by industry (up to NACE A*64) B1G - Value added, gross B-E - Industry (except construction) CLV10_MEUR - Chain linked volumes (2010), million euro
Construction	Gross value added at constant prices, construction	nama_10_a64 - National Accounts aggregates by industry (up to NACE A*64) B1G - Value added, gross F - Construction CLV10_MEUR - Chain linked volumes (2010), million euro
Services	Gross value added at constant prices, services	nama_10_a64 - National Accounts aggregates by industry (up to NACE A*64) B1G - Value added, gross H Transportation and storage I Accommodation and food service activities J Information and communication K Financial and insurance activities L Real estate activities M_N Professional, scientific and technical activities; administrative and support service activities R Arts, entertainment and recreation S Other service activities CLV10_MEUR - Chain linked volumes (2010), million euro
Retail Trade & Consumer	Private final consumption expenditure at constant prices	nama_10_gdp - GDP and main components (output, expenditure and income) P31_S14_S15 - Household and NPISH final consumption expenditure CLV10_MEUR - Chain linked volumes (2010), million euro

Source: European Commission services

On this basis, the percentage for each alternative answer to each question for the EU and the euro area is calculated as the weighted average of the corresponding percentages in each Member State or each euro-area member.

3.5. Seasonal adjustment

Leaving aside strikes, elections, large exchange-rate movements, very cold weather and other special events, business and consumer survey data record opinions that may be influenced by other events taking place at the same time every year. This is the case of, for instance, regular events, such as Christmas, certain public holidays, or the receipt of extraordinary wage bills in a given month of the year. Even though respondents are usually explicitly asked not to take into account such seasonal variations, in practice the answers frequently show seasonal patterns. Such variations in businesses' and consumers' perceptions, opinions or expectations should ideally be eliminated when comparing two consecutive months. This is the goal of seasonal adjustment. Once the balances per question for each survey at the aggregate (country, EU, euro-area) level are calculated, they are seasonally adjusted. Since

1 May 2022, the Commission (DG ECFIN) uses Tramo-Seats with automatic outlier detection for seasonal adjustment¹², implemented as part of the JDemetra+ package and in line with the Guidelines of the European Statistical System (ESS). The RegARIMA model coefficients are updated once a year, in January. Tramo-Seats replaces the previously used Dainties method.

3.6. Calculation of composite indicators

Business and consumer surveys provide monthly judgements and anticipations concerning diverse facets of economic activity in the different sectors of the economy: industry, services, construction and retail trade, as well as consumers. Based on the detailed results of the Harmonised Programme, the Commission calculates and publishes a set of monthly composite indicators.

First, for each of the five surveyed sectors, so-called *confidence indicators* are produced to reflect overall perceptions and expectations at the individual sector level in a one-dimensional index. Each confidence indicator is calculated as the simple arithmetic average of the (seasonally adjusted) balances of answers to specific questions chosen from the full set of questions in each individual survey. The selection of questions is guided by the aim of achieving an as highly as possible coincident correlation of the confidence indicator with a reference series, such as year-on-year growth in industrial production, at EU or euro-area level.¹³ The balance series from the selected questions are not standardised prior to their aggregation.¹⁴

Secondly, in order to be able to track overall economic activity, the broader *Economic Sentiment Indicator* (ESI) has been calculated since 1985. Based on the complete set of balance series underlying the individual confidence indicators, the ESI combines judgements and attitudes of producers and consumers by means of a weighted aggregation of standardised input series. Roughly speaking, the Economic Sentiment Indicator can be viewed as a summary of the five sector-specific confidence indicators (but see 3.6.6. for details).

Thirdly, since 2020, the set of monthly composite indicators published by the Commission also contains an *Employment Expectations Indicator*, which helps getting a timely indication of changes in total employment. The indicator is constructed as a weighted average of the employment expectations of managers in all four surveyed business sectors (i.e. industry, services, retail trade and construction).

Fourthly, since May 2021, the EU BCS Programme features an Economic Uncertainty Indicator. The indicator is a weighted average of the answers of business managers/consumers to a question asking them how difficult it is to make predictions about their future business/financial situation.

Fifthly, the programme features a Labour Hoarding Indicator, which reports the (weighted) percentage of firms which expect (i) their output to decrease, but (ii) their employment to increase or remain unchanged.

Finally, the last part of this section contains a description of a composite indicator for the euro area based on factor methodology. This indicator only refers to manufacturing industry and can therefore be seen as a complement to the industrial confidence indicator.

¹² Deviating from the other survey data, the Labour Hoarding Indicators are seasonally adjusted using the X-13 ARIMA-SEATS method with additive decomposition.

¹³ It has to be noted that the optimal combination of questions to track the reference series can change over time. DG ECFIN regularly checks the tracking performance of its confidence indicators. Structural changes and adjustment processes can lead to (transitory) swings in the performance of cyclical indicators. It is therefore important to base the assessment on a long-term perspective.

¹⁴ While prior standardisation of the components may be preferable from a methodological point of view, the impact on the characteristics of the composite indicators (tracking performance, cyclicity) is negligible. This is due to the fact that the component series tend to be highly synchronised with each other on a sector level, such that any heterogeneity in terms of levels and cyclical amplitudes has only a limited effect on the dynamics of the composite. One advantage of non-standardisation is that the composite indicator keeps the scale and interpretation of a balance of percentage shares of positive and negative replies.

In the following, the calculation method of the indicators is explained in more detail.

3.6.1. Industrial confidence indicator

The industrial confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on production expectations, order books and stocks of finished products (the last with inverted sign). Balances are seasonally adjusted.

Questions (see Annex 2.1.1 for the complete questionnaire):

- Q2** Do you consider your current overall order books to be...?
+ more than sufficient (above normal)
= sufficient (normal for the season)
- not sufficient (below normal)
- Q4** Do you consider your current stock of finished products to be...?
+ too large (above normal)
= adequate (normal for the season)
- too small (below normal)
- Q5** How do you expect your production to develop over the next 3 months? It will...
+ increase
= remain unchanged
- decrease

3.6.2. Services confidence indicator

The services confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on business climate and on recent and expected evolution of demand. Balances are seasonally adjusted.¹⁵

Questions (see Annexes 2.2.1 and 2.7.1 for the complete questionnaires):

- Q1** How has your business situation developed over the past 3 months? It has ...
+ improved
= remained unchanged
- deteriorated
- Q2** How has demand (turnover) for your company's services changed over the past 3 months? It has...
+ increased
= remained unchanged
- decreased
- Q3** How do you expect the demand (turnover) for your company's services to change over the next 3 months? It will...
+ increase
= remain unchanged
- decrease

¹⁵ The confidence indicator for the financial services was calculated exactly in the same way.

3.6.3. Consumer confidence indicator

The consumer confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on the past and expected financial situation of households, the expected general economic situation and the intentions to make major purchases over the next 12 months. Balances are seasonally adjusted.

Questions (see Annex 2.3.1 for the complete questionnaire):

Q1 How has the financial situation of your household changed over the last 12 months? It has...

- + + got a lot better
- + got a little better
- = stayed the same
- got a little worse
- - got a lot worse
- N don't know.

Q2 How do you expect the financial position of your household to change over the next 12 months? It will...

- + + get a lot better
- + get a little better
- = stay the same
- get a little worse
- - get a lot worse
- N don't know.

Q4 How do you expect the general economic situation in this country to develop over the next 12 months? It will...

- + + get a lot better
- + get a little better
- = stay the same
- get a little worse
- - get a lot worse
- N don't know.

Q9 Compared to the past 12 months, do you expect to spend more or less money on major purchases (furniture, electrical/electronic devices, etc.) over the next 12 months? I will spend...

- + + much more
- + a little more
- = about the same
- a little less
- - much less
- N don't know.

3.6.4. Retail trade confidence indicator

The retail trade confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on the present and future business situation, and on stocks (the last with inverted sign). Balances are seasonally adjusted.

Questions (see Annex 2.4.1 for the complete questionnaire):

Q1 How has (have) your business activity (sales) developed over the past 3 months?

- It has (They have) ...
- + improved (increased)
- = remained unchanged

- deteriorated (decreased)

Q2 Do you consider the volume of stock currently hold to be...?

- + too large (above normal)
- = adequate (normal for the season)
- too small (below normal)

Q4 How do you expect your business activity (sales) to change over the next 3 months? It (They) will...

- + improve (increase)
- = remain unchanged
- deteriorate (decrease)

3.6.5. Construction confidence indicator

The construction confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on order book and employment expectations. Balances are seasonally adjusted.

Questions (see Annex 2.5.1 for the complete questionnaire):

Q3 Do you consider your current overall order books to be...?

- + more than sufficient (above normal)
- = sufficient (normal for the season)
- not sufficient (below normal)

Q4 How do you expect your firm's total employment to change over the next 3 months? It will...

- + increase
- = remain unchanged
- decrease

3.6.6. Economic Sentiment Indicator

The Economic Sentiment Indicator (ESI) is made up of the 15 individual components of the previously described confidence indicators. Explicit weights are allocated to the different sectors for the computation of the composite indicator:

- Industry: 40%
- Services: 30%
- Consumers: 20%
- Construction: 5%
- Retail trade: 5%

The given weights have been determined according to two criteria, namely “representativeness” of the sector in question and tracking performance vis-à-vis the reference variable. Corresponding to the broad scope of the ESI, the obvious reference variable is GDP growth, tracking the movements of the economy as a whole.

It is important to note that the above-mentioned weights are not directly applied to the five confidence indicators themselves but to their *standardised* individual component series. The prior standardisation is essential to make the individual component series comparable in terms of both their mean level and volatility before aggregation, especially when the components pertain to developments in different sectors of the economy. Otherwise, component series with relatively high characteristic amplitude

would dominate the evolution of the composite indicator, i.e. the nominal weights would not reflect the factual contribution of each component to the profile of the composite indicator.¹⁶

Since the confidence indicators described above are made up of the same, but *non-standardised* component series, the ESI cannot precisely be derived from applying the given sector weights to the five confidence indicators. In fact, it can occasionally happen that, due to the influence of some more volatile component series, the sum of the (weighted) confidence indicators shows movements that are not reflected in the ESI, summarising the standardised components. In the same way, impulses from rather damped components that are not visible in the confidence indicators may potentially show up in the ESI.¹⁷

The exact calculation of the ESI on the basis of its component series can be summarised by the following three simple steps:

(1) For each component $j = 1, \dots, 15$

$$Y_{j,t} = \frac{X_{j,t} - \bar{X}_j}{S_j} \quad \text{where} \quad \bar{X}_j = \frac{1}{T'} \sum_{t=1}^{T'} X_{j,t} \quad \text{and} \quad S_j = \sqrt{\frac{1}{T'-1} \sum_{t=1}^{T'} (X_{j,t} - \bar{X}_j)^2}$$

(2) $Z_t = \frac{\sum_j w_j \cdot Y_{j,t}}{(\sum_j w_j)_t}$ where $(\sum_j w_j)_t$ is the sum of the weights of the available series at time t

$$(3) \text{ESI}_t = \left(\frac{Z_t - \bar{Z}}{S_Z} \right) \cdot 10 + 100 \quad \text{where} \quad \bar{Z} = \frac{1}{T'} \sum_{t=1}^{T'} Z_t \quad \text{and} \quad S_Z = \sqrt{\frac{1}{T'-1} \sum_{t=1}^{T'} (Z_t - \bar{Z})^2}$$

The X_j variables represent the 15 components of the confidence indicators for industry (3 components), services (3), consumers (4), construction (2) and retail trade (3), as given in Sections 6.1 to 6.5 (seasonally adjusted balances).

The moments for standardisation (step 1) are computed over a frozen sample to avoid monthly revisions of the index. The starting point is January 2000¹⁸. The end-point of the sample, which is updated once a year in January¹⁹, corresponds, in any given year t , to December of the year $t-1$.

To compute the weighted average Z_t (step 2), the above-mentioned sector weights are divided by the number of opinion balances making up the related confidence indicator. So, for example, the three standardised balances relating to service confidence each receive a weight of 10%, adding up to the total services weight of 30%. As long as not all of the 15 components are available, the weighted sum of those series that are available is divided by the sum of the allocated weights.

In the last step (step 3), the resulting weighted average is scaled to have a long-term mean of 100 and a standard deviation of 10, where the same sample is used as for the standardisation of the individual components in step 1. Values greater than 100 indicate an above-average economic sentiment, whereas

¹⁶ For example, the long-term standard deviation of the components of the EU Economic Sentiment Indicator varies between 15.7 (question Q1 in the services sector) and 3.6 (question Q2 in the retail trade sector).

¹⁷ Empirical evidence suggests that the impact of the (non-) standardisation of the component series on the tracking performance of the composite indicator is usually negligible.

¹⁸ Since February 2020, the starting point of the standardisation window applied is 2000 since (i) this is in line with the construction of the Employment Expectations Indicator (EEI) and thus enhances the scope for meaningful comparisons of the two indicators across time and (ii) it ensures a higher degree of cross-country comparability than the previously applied standardisation sample (from 1990 onwards), which comprised prolonged periods in which survey data were not available for countries having accessed the EU since the 2000s.

¹⁹ It should be noted that the long-term moments of the balance series are fairly stable due to their stationary nature so that updates in the sample considered for standardisation have only a very limited effect.

values below 100 indicate a below-average position. Assuming approximate normality, the imposed standard deviation of 10 implies that in about 68% of the cases the ESI will be within the range of 90 to 110.

The performance of the ESI, which summarises the attitudes and judgements of a large number of economic actors, should be compared with the performance of a reference variable which is also all-inclusive, recording movements in the economy as a whole. Hence, as mentioned previously, GDP growth is the obvious choice for testing the explanatory performance of the composite indicator.

3.6.7. Employment Expectations Indicator

The Employment Expectations Indicator (EEI)²⁰ is made up of four seasonally adjusted balances (in percentage points) which summarise managers' answers to a question about their employment plans in, respectively, the industry, services, retail trade and construction sector.

The exact wording of the question is:

How do you expect your firm's total employment to change over the next 3 months? It will...

- + increase
- = remain unchanged
- decrease

The question corresponds to **Q7** of the industry survey, **Q5** of the services survey, **Q5** of the retail trade survey and **Q4** of the construction survey (see Annex 2.5.1 for the complete questionnaire).

Before being summarised in one composite indicator, the four balance series are weighted so that the relative importance of each economic sector for overall employment is adequately reflected. To that end, a time series of weights is created for every sector, reporting the ratio of the sector's²¹ employment over total employment in all four sectors. The time series are calculated on the basis of annual Eurostat data starting in 2000. The final weight for each sector corresponds to the average value reported in the sector-specific time series. Every year in January, the weights are updated, taking on board newly released²² employment data for the calculation of the above-described average.

The weights are applied to the four balance series, which are expressed in *standardised* form. The prior standardisation is essential to make the balance series comparable in terms of both their mean level and volatility before aggregation, especially since the series capture developments in different sectors of the economy. If standardisation was skipped, balance series with a relatively high characteristic amplitude would dominate the evolution of the composite indicator, i.e. the nominal weights would not reflect the factual contribution of each component to the profile of the composite indicator.²³

The exact calculation of the EEI on the basis of its four component series can be summarised by the following three simple steps:

(1) For each component $j = 1, \dots, 4$

$$Y_{j,t} = \frac{X_{j,t} - \bar{X}_j}{S_j} \text{ where } \bar{X}_j = \frac{1}{T'} \sum_{t=1}^{T'} X_{j,t} \text{ and } S_j = \sqrt{\frac{1}{T'-1} \sum_{t=1}^{T'} (X_{j,t} - \bar{X}_j)^2}$$

²⁰ For a presentation of the EEI, see the 2019-Q4 special topic of the [European Business Cycle Indicators](#) publication.

²¹ The sectors are defined as covering the following headings of the NACE Rev. 2 classification: headings B to E (industry), headings H to N and R to S (services), heading G (retail trade), heading F (construction).

²² The employment data are released with a significant time-lag so that an update in January of year t adds a new data-point in year t-2.

²³ The long-term standard deviations of the four balance series feeding into the EA Employment Expectations Indicator vary between 5.0 (question Q5 in the retail trade sector) and 11.1 (question Q4 in the construction sector).

(2) $Z_t = \sum_j w_j \cdot Y_{jt}$ where w_j is the weight of series j as described above and $\sum_j w_j$ is equal to 1 by construction.

$$(3) EEI_t = \left(\frac{Z_t - \bar{Z}}{S_z} \right) \cdot 10 + 100 \text{ where } \bar{Z} = \frac{1}{T'} \sum_{t=1}^{T'} Z_t \text{ and } S_z = \sqrt{\frac{1}{T'-1} \sum_{t=1}^{T'} (Z_t - \bar{Z})^2}$$

The X_j variables represent the four balance series. The moments for standardisation (step 1) are computed over a frozen sample to avoid monthly revisions of the index. To ensure consistency with the calculation of the sectoral weights, the starting point of the sample considered is 2000 or, in the case of countries with shorter employment expectation series, the first year in which employment expectations are available for all four business sector. The end-point of the sample, which is updated once a year²⁴ in January, corresponds, in any given year t , to December of the year $t-1$.

Once the weighted average of all four standardised balance series is computed (step 2), the resulting time-series is scaled to have a long-term mean of 100 and a standard deviation of 10 (step 3). The sample considered for standardisation is the same one as in step 1. Values greater than 100 indicate that managers' employment expectations are high by historical standards, while the opposite holds true for values below 100. Assuming approximate normality, the imposed standard deviation of 10 implies that in about 68% of the cases the EEI will be within the range of 90 to 110.

Considering that it summarises the employment plans of managers across four major economic sectors, the performance of the EEI in anticipating/tracking developments in official statistical data should best be assessed by comparing its evolution to developments in total (quarter-on-quarter) employment growth.

3.6.8. Economic Uncertainty Indicator

The Economic Uncertainty Indicator (EUI)²⁵ is made up of five balances (in percentage points)²⁶ which summarise managers'/consumers' answers to a question asking them to indicate how difficult it is to make predictions about their future business/financial situation. The series are not seasonally adjusted, as they do not yet have the necessary minimum length.

The exact wording of the question in the industry, services, retail trade and construction survey is:

The future development of your business situation is currently

- + + easy to predict
- + moderately easy to predict
- moderately difficult to predict
- - difficult to predict

The corresponding question in the consumer survey reads:

The future financial position/situation of your household is currently

- ++ easy to predict
- + moderately easy to predict
- moderately difficult to predict
- difficult to predict
- N don't know

²⁴ It should be noted that the long-term moments of the balance series are fairly stable due to their stationary nature so that updates in the sample considered for standardisation have only a very limited effect.

²⁵ For a presentation of the EUI, see the 2021-Q3 special topic of the [European Business Cycle Indicators](#) publication.

²⁶ Deviating from the usual practice, the shares of positive answers are subtracted from the negative ones, rather than vice versa, see section 3.3.

The above questions correspond to **Q51** of the industry survey, **Q31** of the services survey, **Q41** of the retail trade and construction surveys and **Q21** of the consumer survey (see Annex 2.5.1 for the complete questionnaire).

Before being summarised in one composite indicator, the five balance series are weighted by the same weights as those deployed for the Economic Sentiment Indicator:

- Industry: 40%
- Services: 30%
- Consumers: 20%
- Construction: 5%
- Retail trade: 5%

The exact calculation of the EUI on the basis of its five component series is as follows:

For each component $j = 1, \dots, 5$

$EUI_t = \sum_j w_j \cdot X_{jt}$ where w_j is the weight of series j as described above, $\sum_j w_j$ is equal to 1 by construction and the X_j variables represent the five balance series.

As the above mentioned uncertainty questions became a compulsory component of the EU BCS Programme only in May 2021, a complete coverage across all sectors and countries is only available for a relatively short time-span. However, a number of partner institutes of the Commission agreed to participate in a pilot-phase in spring/summer 2019 and a few of them continued asking the uncertainty questions ever since that testing phase. The data gathered before May 2021 have been harnessed by the Commission to estimate longer time-series for the sectoral uncertainty indicators and the cross-sectoral EUI at EU/EA level.

For extending the time series at EU/EA level, the estimation procedure zooms into each of the five surveyed sectors (industry, services, etc.) and identifies (i) all months in which uncertainty data is available for all member countries and (ii) all months in which data is not available for all countries but at least for 20%²⁷ of them. For each month t , which is of type (ii), the difference between the average uncertainty across the available countries in month t and the average uncertainty across the same set of countries in months $t-1$ is calculated²⁸ (a-difference). The same is done with respect to the same set of countries in $t+1$ (b-difference). Subsequently, all months t of type (i) which are followed by one or several month/s of type (ii) are identified and the a-differences of month $t+1$, $t+2$, etc. are applied to estimate the average uncertainty for those subsequent months (forward-looking time-series). By the same token, all months t of type (i) which are *preceded* by one or several month/s of type (ii) are identified and the b-differences of month $t-1$, $t-2$, etc. are deployed to estimate average uncertainty levels for the preceding months (backward-looking time-series). In a last step, a final consolidated uncertainty time series is created which corresponds, in a month of type (i), to the average uncertainty across all member countries and, in all months of type (ii), to the average of the forward- and backward-looking time series or, in case only one of the two is available²⁹, to that particular series.

Once the described procedure has been applied to all surveyed sectors, the (cross-sectoral) EU/EA EUI can be calculated as the weighted average of the sectoral EU/EA uncertainty series. The application of the described approach enabled the Commission to produce an EU and EA EUI going back to April 2019.

²⁷ 20% does not refer to the actual numeric share of the available countries, but to their share in the EA's/EU's sectoral output, such as gross-value added in industry, private consumption, etc. (see Section 3.4. for an overview of the sectoral reference series).

²⁸ The mean uncertainty levels are, in fact, weighted averages taking into account countries' respective shares in EU/EA wide sectoral output.

²⁹ Prior to the earliest month of type (i) only a backward-looking time-series is available, while, subsequent to the last month of type (i), only a forward-looking one.

The logic of the above-described procedure was applied analogously for extending the cross-sectoral EUIs of individual countries. Rather than identifying months in which data is available for less than 100%, but more than 20% of the member countries, the procedure selects months in which data is incomplete, but available for sectors representing at least 30%³⁰ of the economy of a given country. Subsequently, a- and b-differences are calculated for those months and used to produce forward- and backward-looking uncertainty time series. In a final step, for a given country, the time series capturing average cross-sectoral uncertainty (EUI) is extended by means of the newly generated forward- and/or backward-looking time series.

3.6.9. Labour Hoarding Indicator

The construction of the Labour Hoarding Indicator (LHI) is based on a survey question capturing managers' employment expectations and a question on their output expectations.

The formulation of the employment question is identical across all business surveys: "How do you expect your firm's total employment to change over the next 3 months? It will... + increase, = remain unchanged, - decrease". The question corresponds to **Q7** of the industry survey, **Q5** of the services survey, **Q5** of the retail trade survey and **Q4** of the construction survey (see Annex 2.5.1 for the complete questionnaire).

Regarding managers' output expectations, questions differ slightly across the four business surveys. Namely, they refer to expectations of production in the industry survey (**Q5**), of change in demand (turnover) in the services survey (**Q3**) and of change in business activity (sales) for retail trade (**Q4**). The answer options are broadly the same in the three questions: +increase/improve, =remain unchanged and -decrease/deteriorate. In the construction survey, the question used (**Q3**) is the one asking managers to assess the level of their current overall order books³¹ (answer options: +more than sufficient (above normal), =sufficient (normal for the season), -not sufficient (below normal)).

The construction of the LHI involves several steps:

(1) Firms which (i) expect their output to decrease / assess their orders as insufficient (below normal) and (ii) expect their employment to increase or remain unchanged are categorized as hoarding labour (LHI = 1). All firms with different answering pattern are categorized as LHI=0.

(2) The resulting binary values for the individual firms are aggregated for a given country and sector (e.g. Belgium industry) as weighted averages. While the weighting-scheme deployed can slightly vary across countries, depending on country specificities and data availability, it is usually based on the number of employees for the first stage (within branches) and sectoral value added for higher aggregates. The resulting value reflects the (weighted) percentage of firms that hoard labour in a specific country and in each of the four sectors.

(3) The following headline indicators are created:

- (i) for each country, an aggregate LHI capturing the prevalence of labour hoarding in the entire economy, calculated as the weighted average of the sector-specific LHIs,
- (ii) at EU and euro-area (EA) level, sector-specific LHIs (e.g. EU industry, EA services, etc.), calculated as the weighted average of the country-specific sectoral LHIs,
- (iii) at EU and EA level, an aggregate LHI, calculated as the weighted average of the EU/EA sectoral LHIs defined in the previous bullet.

³⁰ The joint weight of the sectors for which data is available is calculated by applying the sectoral weights used for the calculation of the Economic Sentiment Indicator (i.e. industry: 40%, services: 30%, consumers: 20%, construction: 5%, retail trade: 5%).

³¹ In the construction survey, there is no question on output expectations. However, current order books can be seen to reflect, to a significant extent, future construction output.

The weights applied reflect the share of each economic sector³² in overall employment in a specific country (point (3)(i)) or in the EU/EA as a whole (point (3)(iii)). In the case of (3)(ii), the weights reflect the share of each country in EU/EA-wide employment of a given sector. The weights are calculated on the basis of annual Eurostat data starting in 2000. The final weight for each sector/country corresponds to the average value observed since 2000. Every year in January, the weights are updated, taking on board newly released³³ employment data for the calculation of the above-described shares.

The length of the labour hoarding time-series differs across countries and sectors, depending on the availability of the underlying historic micro-data. To increase the length of the headline indicators, they are calculated as from the moment when the available labour hoarding data satisfy the following thresholds:

- For country-specific cross-sectoral LHIs (point (3)(i)): available sectors must represent $\geq 30\%$ of national employment
- For sector-specific LHI at EU/EA level (point (3)(ii)): available countries must represent $\geq 50\%$ of employment in the sector
- For cross-sectoral LHI at EU/EA level (point (3)(iii)): available EU/EA sectors must represent $\geq 30\%$ of EU/EA employment

3.6.10. Business Climate Indicator

The Business Climate Indicator (BCI) is calculated in order to receive a timely composite indicator for the manufacturing sector in the euro area. The indicator uses, as input series, five balances of opinion from the industry survey: production trends in recent months, order books, export order books, stocks and production expectations. The BCI therefore deviates from the industrial confidence indicator, which is based on only three input series. Also, the method to construct the BCI is different from that of the confidence indicator. The BCI is based on the notion that each of the five component questions can be represented by a *common* factor that summarises the underlying cyclical situation at a particular moment in time and by a *specific* factor that applies to the question only. The basic idea of this division is to separate out the information that is common to all series from idiosyncratic movements in a specific series. The BCI is then defined as the common factor, while the specific factors are left out. Being the common factor extracted from five monthly industry questions, the BCI is supposed to move contemporaneously with overall industrial activity in the euro area.

More generally, factor analysis is a class of statistical methods used to summarise a set of variables by constructing a few “common factors” related to all of the variables and “specific factors” related to each individual variable only. It therefore represents a formalisation of Burns and Mitchell’s (1946) notion that business cycles represent co-movements in a set of economic time series.

The methodology is based on very classical principles. A set of p observed variables (balances of opinion) are summarised by a small number $k < p$ of latent variables called common factors. The underlying model supposes that each of the p observed variables results from the combination of both a small number of *common factors* F_j and an idiosyncratic component u_i

$$z_{it} = l_{i1}F_{1t} + \dots + l_{ik}F_{kt} + u_{it} \quad , i = 1, \dots, p$$

where z denotes the value of the i^{th} standardised observed variable at time t . The term

³² The sectors are defined as covering the following headings of the NACE Rev. 2 classification: headings B to E (industry), headings H to N and R to S (services), heading G (retail trade), heading F (construction).

³³ The employment data are released with a significant time-lag so that an update in January of year t adds a new data-point in year $t-2$.

$$\chi_{it} \equiv z_{it} - u_{it} = l_{i1}F_{1t} + \dots + l_{ik}F_{kt}$$

defines the *common component* of variable i , and is itself driven by the k common factors.

The factors are supposed to be uncorrelated with each other and with the idiosyncratic factors. The latter are also uncorrelated with each other. The *loadings* l_{ij} , $j=1, \dots, k$, give the individual correlations of the k common factors with the i_{th} variable. The squared loadings l_{ij}^2 provide the share of variance of variable i explained by factor j . Adding them over the k factors results in the *communality* of variable i , representing the share of variance explained by all of the extracted factors.³⁴

4. DATA DISSEMINATION AND PUBLICATION

4.1. Publication of survey results

The detailed Business and Consumer Survey results are published two working days³⁵ before the end of each month by means of a press release and are sent by e-mail to a selected group of news agencies.

The press release reports the detailed BCS results plus the sectoral confidence indicators, the Economic Sentiment Indicator (ESI), the Employment Expectations Indicator (EEI), the Economic Uncertainty Indicator (EUI) and the Labour Hoarding Indicator (LHI). It is divided into two parts: a first part with comments on the main results of the surveys and a second part (contained in a separate pdf-file) with detailed tables showing the results.

The results of the consumer confidence indicator at the aggregate EU and euro area levels are published in a Flash release one week ahead of the detailed consumer survey results (i.e. around the 20th of each month).

All press releases and a publication calendar are available on DG ECFIN's website at: https://economy-finance.ec.europa.eu/economic-forecast-and-surveys/business-and-consumer-surveys/latest-business-and-consumer-surveys_en#latest .

Furthermore, all the data reported in the press releases plus additional data (long-time series, non-seasonally adjusted sector series, seasonally adjusted branch data, detailed data by answer category) are freely downloadable (excel files) from: [Time series](#).³⁶

The results of the quarterly survey in the manufacturing sector are reported in the press release of the first month of the quarter (i.e. January, April, July and October). The results of the bi-annual survey on investments are reported in the April and November press releases.

At the beginning of January, April, July and October, the Commission publishes a quarterly report, the 'European Business Cycle Indicators' (EBCI). Focusing on major developments in survey data from a quarterly perspective, it allows for clearer messages on changes in trends (which are usually not detectable on a month-by-month basis) and is therefore a valuable complement to the monthly press releases. Apart from the standard section, the report also includes an analytical 'highlight section' presenting topical research using survey data from the BCS Programme. The fourth quarter issue of the EBCI is also used to present and analyse the results of the October/November Investment surveys in some detail. The ECBI publication is available on DG ECFIN's website at:

³⁴ In the case of the BCI, k is set to 1. Additional information on how the Business Climate Indicator is constructed can be found on the webpage:

https://ec.europa.eu/economy_finance/db_indicators/surveys/documents/studies/bci_presentation_paper.pdf

³⁵ The December results are published in early January of the following year.

³⁶ Also the historical data of the Financial Services Sector Survey continue to be available for download.

[Economy, finance and the euro publications.](#)

4.2. Metadata

The harmonised business and consumer surveys are carried out in a decentralised manner by individual institutes in the Member States. Notwithstanding the harmonised schedule and the common principle of representative sampling, the individual institutes are responsible for determining their sampling frame, sampling and survey methods.

All the information concerning the questionnaires in the language of the respective Member state, the methodology used in each country for each survey as well as other useful information on the national institutes conducting the surveys (incl. contact persons) is available in the metadata section of DG ECFIN's BCS website at:

[BCS Programme: National Questionnaires](#)

[BCS Programme: Partner institutes](#)

[BCS Programme: Metadata of partner institutes](#)

ANNEXES

ANNEX

QUESTIONNAIRES AND CLASSIFICATIONS

1. THE JOINT HARMONISED EU INDUSTRY SURVEY

1.1. Industry survey - Questionnaire

Monthly questions

- Q1** How has your production developed over the past 3 months? It has...
- + increased
 - = remained unchanged
 - decreased
- Q2** Do you consider your current overall order books to be...?
- + more than sufficient (above normal)
 - = sufficient (normal for the season)
 - not sufficient (below normal)
- Q3** Do you consider your current export order books to be...?
- + more than sufficient (above normal)
 - = sufficient (normal for the season)
 - not sufficient (below normal)
- Q4** Do you consider your current stock of finished products to be...?
- + too large (above normal)
 - = adequate (normal for the season)
 - too small (below normal)
- Q5** How do you expect your production to develop over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease
- Q51** The future development of your business situation is currently
- ++ easy to predict
 - + moderately easy to predict
 - moderately difficult to predict
 - difficult to predict
- Q6** How do you expect your selling prices to change over the next 3 months?
- They will...
- + increase
 - = remain unchanged
 - decrease

- Q7** How do you expect your firm's total employment to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease

Quarterly questions (January, April, July and October)

- Q8** What main factors are currently limiting your production?

- none
- insufficient demand
- shortage of labour force
- shortage of material and/or equipment
- financial constraints
- other factors

- Q9** Considering your current order books and the expected change in demand over the coming months, how do you assess your current production capacity?

The current production capacity is....

- + more than sufficient
- = sufficient
- not sufficient

- Q10** How many months of production are assured by your current overall order books?

Our production is assured for . months

- Q11** How have your orders developed over the past 3 months?

They have...

- + increased
- = remained unchanged
- decreased

- Q12** How do you expect your export orders to develop over the next 3 months?

They will...

- + - increase
- = - remain unchanged
- - decrease

- Q13** At what capacity is your company currently operating (as a percentage of full capacity)?

The company is currently operating at . % of full capacity.

Q14 How has your competitive position on the domestic market developed over the past 3 months? It has...

- + improved
- = remained unchanged
- deteriorated

Q15 How has your competitive position on foreign markets inside the EU developed over the past 3 months? It has...

- + improved
- = remained unchanged
- deteriorated

Q16 How has your competitive position on foreign markets outside the EU developed over the past 3 months? It has...

- + improved
- = remained unchanged
- deteriorated

March/April survey

Q17 Compared with two years ago (t-2) your investment last year (t-1) has...

	+ increased	= remained unchanged	- decreased
Overall investment			
Machinery and equipment			
Land, building and infrastructure			
Intangibles (R&D, software, data, intellectual property, vocational training, etc.)			

Q18 Compared with last year (t-1) your investment this year (t) will...

	+ increase	= remain unchanged	- decrease
Overall investment			
Machinery and equipment			
Land, building and infrastructure			
Intangibles (R&D, software, data, intellectual property, vocational training, etc.)			

October/November survey

Q19 Compared with last year (t-1) your investment this year (t) will...

- + increase
- = remain unchanged
- decrease

Q20 Compared with this year (t) your investment next year (t+1) will...

- + increase
- = remain unchanged
- decrease

Q21 Structure of the investment: Investment carried out this year and planned investment for next year is, or will be, of the following kind (choose the appropriate category or categories):

	for this year	for next year
Replacement of worn-out plant or equipment		
Extension of production capacity		
Investment designed to streamline production		
Other investment objectives (pollution control, safety, etc.)		

Q22 What main **factors are stimulating** your investment?

	for this year	for next year
Demand		
Financial conditions		
Technical factors		
Other factors		

1.2. Industry survey - Classification of sectors (NACE Rev. 2) and allocation of NACE headings to main industrial groupings

NACE CODE	DESCRIPTION	MIG
10	Manufacture of food products	
10.1	Processing and preserving of meat and production of meat products	CNDU
10.2	Processing and preserving of fish, crustaceans and molluscs	CNDU
10.3	Processing and preserving of fruit and vegetables	CNDU
10.4	Manufacture of vegetable and animal oils and fats	CNDU
10.5	Manufacture of dairy products	CNDU
10.6	Manufacture of grain mill products, starches and starch products	INTM
10.7	Manufacture of bakery and farinaceous products	CNDU
10.8	Manufacture of other food products	CNDU
10.9	Manufacture of prepared animal feeds	INTM
11	Manufacture of beverages	CNDU
12	Manufacture of tobacco products	CNDU
13	Manufacture of textiles	
13.1	Preparation and spinning of textile fibres	INTM
13.2	Weaving of textiles	INTM
13.3	Finishing of textiles	INTM
13.9	Manufacture of other textiles	CNDU
14	Manufacture of wearing apparel	CNDU
15	Manufacture of leather and related products	CNDU
16	Manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials	INTM
17	Manufacture of paper and paper products	INTM
18	Printing and reproduction of recorded media	CNDU
19	Manufacture of coke and refined petroleum products	
20	Manufacture of chemicals and chemical products	
20.1	Manufacture of basic chemicals, fertilisers and nitrogen compounds, plastic and synthetic rubber in primary forms	INTM
20.2	Manufacture of pesticides and other agrochemical products	INTM
20.3	Manufacture of paints, varnishes and similar coatings, printing ink and mastics	INTM
20.4	Manufacture of soap and detergents, cleaning and polishing preparations, perfumes and toilet preparations	CNDU
20.5	Manufacture of other chemical products	INTM
20.6	Manufacture of man-made fibres	INTM
21	Manufacture of basic pharmaceutical products and pharmaceutical preparations	CNDU
22	Manufacture of rubber and plastic products	INTM
23	Manufacture of other non-metallic mineral products	INTM
24	Manufacture of basic metals	INTM
25	Manufacture of fabricated metal products, except machinery and equipment	
25.1	Manufacture of structural metal products	INVE
25.2	Manufacture of tanks, reservoirs and containers of metal	INVE
25.3	Manufacture of steam generators, except central heating hot water boilers	INVE
25.4	Manufacture of weapons and ammunition	INVE
25.5	Forging, pressing, stamping and roll-forming of metal; powder metallurgy	INTM
25.6	Treatment and coating of metals; machining	INTM
25.7	Manufacture of cutlery, tools and general hardware	INTM
25.9	Manufacture of other fabricated metal products	INTM
26	Manufacture of computer, electronic and optical products	
26.1	Manufacture of electronic components and boards	INTM

	26.2	Manufacture of computers and peripheral equipment	INVE
	26.3	Manufacture of communication equipment	INVE
	26.4	Manufacture of consumer electronics	CDUR
	26.5	Manufacture of instruments and appliances for measuring, testing and navigation; watches and clocks	INVE
	26.6	Manufacture of irradiation, electromedical and electrotherapeutic equipment	INVE
	26.7	Manufacture of optical instruments and photographic equipment	CDUR
	26.8	Manufacture of magnetic and optical media	INTM
27		Manufacture of electrical equipment	
	27.1	Manufacture of electric motors, generators, transformers and electricity distribution and control apparatus	INTM
	27.2	Manufacture of batteries and accumulators	INTM
	27.3	Manufacture of wiring and wiring devices	INTM
	27.4	Manufacture of electric lighting equipment	INTM
	27.5	Manufacture of domestic appliances	CDUR
	27.9	Manufacture of other electrical equipment	INTM
28		Manufacture of machinery and equipment n.e.c.	INVE
29		Manufacture of motor vehicles, trailers and semi-trailers	INVE
30		Manufacture of other transport equipment	
	30.1	Building of ships and boats	INVE
	30.2	Manufacture of railway locomotives and rolling stock	INVE
	30.3	Manufacture of air and spacecraft and related machinery	INVE
	30.4	Manufacture of military fighting vehicles	INVE
	30.9	Manufacture of transport equipment n.e.c.	CDUR
31		Manufacture of furniture	CDUR
32		Other manufacturing	
	32.1	Manufacture of jewellery, bijouterie and related articles	CDUR
	32.2	Manufacture of musical instruments	CDUR
	32.3	Manufacture of sports goods	CNDU
	32.4	Manufacture of games and toys	CNDU
	32.5	Manufacture of medical and dental instruments and supplies	INVE
	32.9	Manufacturing n.e.c.	CNDU
33		Repair and installation of machinery and equipment	INVE
CDUR		Durable consumer goods	
CNDU		Non-durable consumer goods	
FOBE		Food and beverages industry (10.1-10.5, 10.7-10.8, 11, 12)	
CONS		Consumer goods (CDUR+CNDU)	
INTM		Intermediate goods (excluding mining and quarrying)	
INVE		Investment goods	
TOTA		Total manufacturing = CONS + INTM + INVE + 19	

2. THE JOINT HARMONISED EU SERVICES SURVEY

2.1. Services survey - Questionnaire

Monthly questions

- Q1** How has your business situation developed over the past 3 months? It has...
- + improved
 - = remained unchanged
 - deteriorated
- Q2** How has demand (turnover) for your company's services changed over the past 3 months? It has...
- + increased
 - = remained unchanged
 - decreased
- Q3** How do you expect the demand (turnover) for your company's services to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease
- Q31** The future development of your business situation is currently
- ++ easy to predict
 - + moderately easy to predict
 - moderately difficult to predict
 - difficult to predict
- Q4** How has your firm's total employment changed over the past 3 months? It has...
- + increased
 - = remained unchanged
 - decreased
- Q5** How do you expect your firm's total employment to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease
- Q6** How do you expect the prices you charge to change over the next 3 months? They will...
- + increase
 - = remain unchanged
 - decrease

Quarterly question (January, April, July and October)

Q7 What main factors are currently limiting your business?

- none
- insufficient demand
- shortage of labour force
- shortage of space and/or equipment
- financial constraints
- other factors

Q8 If the demand expanded, could you increase your volume of activity with your present resources? Yes –No

If so, by how much? ...%

Bi-annual questions on investment plans

March/April survey

Q9 Compared with two years ago (t-2) your investment last year (t-1) has...

	+	=	-
	increased	remained unchanged	decreased
Overall investment			
Machinery and equipment			
Land, building and infrastructure			
Intangibles (R&D, software, data, intellectual property, vocational training, etc.)			

Q10 Compared with last year (t-1) your investment this year (t) will...

	+	=	-
	increase	remain unchanged	decrease
Overall investment			
Machinery and equipment			
Land, building and infrastructure			
Intangibles (R&D, software, data, intellectual property, vocational training, etc.)			

October/November survey

Q11 Compared with last year (t-1) your investment this year (t) will...

+ increase

= remain unchanged

– decrease

Q12 Compared with this year (t) your investment next year (t+1) will...

+ increase

= remain unchanged

– decrease

Q13 Structure of the investment: Investment carried out this year and planned investment for next year is, or will be, of the following kind (choose the appropriate category or categories):

	for this year	for next year
Replacement of worn-out buildings, equipment and IT		
Extension of capacity for existing or new products/services		
Investment designed to streamline processes		
Other investment objectives (regulatory obligations, safety, etc.)		

Q14 What main **factors are stimulating** your investment?

	for this year	for next year
Demand		
Financial conditions		
Technical factors		
Other factors		

2.2. Services survey - Classification of sectors (NACE Rev. 2)

NACE CODE	DESCRIPTION
H	Transportation and storage
49	Land transport and transport via pipelines
50	Water transport
51	Air transport
52	Warehousing and support activities for transportation
53	Postal and courier activities
I	Accommodation and food service activities
55	Accommodation
56	Food and beverage service activities
J	Information and communication
58	Publishing activities
59	Motion picture, video and television programme production, sound recording and music publishing activities
60	Programming and broadcasting activities
61	Telecommunication
62	Computer programming, consultancy and related activities
63	Information service activities
K	Financial and insurance activities
64	Financial service activities, except insurance and pension funding
65	Insurance, reinsurance and pension funding, except compulsory social security
66	Activities auxiliary to financial services and insurance activities
L	Real estate activities
68	
M	Professional, scientific and technical activities
69	Legal and accounting activities
70	Activities of head offices; management consultancy activities

71	Architectural and engineering activities; technical testing and analysis
72	Scientific research and development
73	Advertising and market research
74	Other professional, scientific and technical activities
75	Veterinary activities
N	Administrative and support service activities
77	Rental and leasing activities
78	Employment activities
79	Travel agency, tour operator and other reservation service and related activities
80	Security and investigation activities
81	Services to buildings and landscape activities
82	Office administrative, office support and other business support activities
R	Arts, entertainment and recreation
90	Creative, arts and entertainment activities
91	Libraries, archives, museums and other cultural activities
92	Gambling and betting activities
93	Sports activities and amusement and recreation activities
S	Other service activities
94	Activities of membership organisations
95	Repair of computers and personal and household goods
96	Other personal service activities
TOTS	Total

3. THE JOINT HARMONISED EU CONSUMER SURVEY

3.1. Consumer survey - Questionnaire

Monthly questions

Q1 How has the financial situation of your household changed over the last 12 months? It has...

- ++ got a lot better
- + got a little better
- = stayed the same
- got a little worse
- got a lot worse
- N don't know.

Q2 How do you expect the financial position of your household to change over the next 12 months? It will...

- ++ get a lot better
- + get a little better
- = stay the same
- get a little worse
- get a lot worse
- N don't know.

Q21 The future financial position/situation of your household is currently

- ++ easy to predict
- + moderately easy to predict
- moderately difficult to predict
- difficult to predict
- N don't know.

Q3 How do you think the general economic situation in the country has changed over the past 12 months? It has...

- ++ got a lot better
- + got a little better
- = stayed the same
- got a little worse
- got a lot worse
- N don't know.

Q4 How do you expect the general economic situation in this country to develop over the next 12 months? It will...

- ++ get a lot better
- + get a little better
- = stay the same
- get a little worse
- get a lot worse
- N don't know.

Q5 How do you think that consumer prices have developed over the last 12 months? They have...

- ++ risen a lot
- + risen moderately
- = risen slightly
- stayed about the same
- fallen
- N don't know.

Q51 If question 5 was answered by 1, 2, 3 or 5:

By how many per cent do you think that consumer prices have gone up/down over the past 12 months? (Please give a single figure estimate).

Consumer prices have increased by % / decreased by %.

Q6 By comparison with the past 12 months, how do you expect that consumer prices will develop in the next 12 months? They will...

- ++ increase more rapidly
- + increase at the same rate
- = increase at a slower rate
- stay about the same
- fall
- N don't know.

Q61 If question 6 was answered by 1, 2, 3 or 5:

By how many per cent do you expect consumer prices to go up/down change in the next 12 months? (Please give a single figure estimate).

Consumer prices will increase by % / decrease by %.

Q7 How do you expect the number of people unemployed in this country to change over the next 12 months? The number will...

- ++ increase sharply
- + increase slightly
- = remain the same
- fall slightly
- fall sharply
- N don't know.

Q8 In view of the general economic situation, do you think that now it is the right moment for people to make major purchases such as furniture, electrical/electronic devices, etc.?

- ++ yes, it is the right moment now
- = it is neither the right moment nor the wrong moment
- no, it is not the right moment now
- N don't know.

Q9 Compared to the past 12 months, do you expect to spend more or less money on major purchases (furniture, electrical/electronic devices, etc.) over the next 12 months? I will spend...

- ++ much more
- + a little more
- = about the same
- a little less
- much less
- N don't know.

Q10 In view of the general economic situation, do you think that now is...?

- ++ a very good moment to save
- + a fairly good moment to save
- not a good moment to save
- a very bad moment to save
- N don't know.

Q11 Over the next 12 months, how likely is it that you save any money?

- ++ very likely
- + fairly likely
- not likely
- not at all likely
- N don't know.

Q12 Which of these statements best describes the current financial situation of your household?

- ++ we are saving a lot

- = we are just managing to make ends meet on our income
- we are having to draw on our savings
- we are running into debt
- N don't know.

Quarterly questions (January, April, July and October)

Q13 How likely are you to buy a car over the next 12 months?

- + + very likely
- + fairly likely
- not likely
- - not at all likely
- N don't know.

Q14 Are you planning to buy or build a home over the next 12 months (to live in yourself, for a member of your family, as a holiday home, to let etc.)?

- + + yes, definitely
- + possibly
- probably not
- - no
- N don't know.

Q15 How likely are you to spend any large sums of money on home improvements or renovations over the next 12 months?

- + + very likely
- + fairly likely
- not likely
- - not at all likely
- N don't know.

3.2. Consumer survey - Categories

A. Income of the household

- 1st Quartile
- 2nd Quartile
- 3rd Quartile
- 4th Quartile

B. Occupation of respondent

- Managers and professionals (ISCO-08: 11 to 14 and 21 to 26)
- Technicians and associate professionals (ISCO-08: 31 to 35)
- Clerical and support workers, services and sales workers (ISCO-08: 41 to 44 and 51 to 54)
- Skilled agricultural, forestry and fishery workers; craft and related trade workers (ISCO-08: 61 to 63 and 71 to 75)
- Plant and machine operators, assemblers and elementary occupations (ISCO-08: 81 to 83 and 91 to 96)

Total employed (ISCO-08: 11 to 96)

- Unemployed
- In retirement or early retirement/widow/widower receiving pension after partner died /permanently disabled or chronically ill
- Other occupations (student or further training experience or unpaid work experience/ fulfilling domestic task/housekeeper or child care/in compulsory military or community service/other)

Total unemployed and other occupations

C. Working regime of respondent

- Work full-time
- Work part-time

D. Education of respondent

- Primary
- Secondary
- Further

E. Age of respondent

- 16-29
- 30-49
- 50-64
- 65+

F. Sex of respondent

- Male
- Female

4. THE JOINT HARMONISED EU RETAIL TRADE SURVEY

4.1. Retail trade survey - Questionnaire

Monthly questions

- Q1** How has (have) your business activity (sales) developed over the past 3 months?
It has... (They have...)
- + improved (increased)
 - = remained unchanged
 - deteriorated (decreased)
- Q2** Do you consider the volume of stock you currently hold to be...?
- + too large (above normal)
 - = adequate (normal for the season)
 - too small (below normal)
- Q3** How do you expect your orders placed with suppliers to change over the next 3 months?
They will...
- + increase
 - = remain unchanged
 - decrease
- Q4** How do you expect your business activity (sales) to change over the next 3 months? It
(They) will...
- + improve (increase)
 - = remain unchanged
 - deteriorate (decrease)
- Q41** The future development of your business situation is currently
- + + easy to predict
 - + moderately easy to predict
 - moderately difficult to predict
 - - difficult to predict
- Q5** How do you expect your firm's total employment to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease
- Q6** How do you expect the prices you charge to change over the next 3 months?
They will...
- + increase
 - = remain unchanged
 - decrease

4.2. Retail trade survey - Classification of sectors (NACE Rev. 2)

NACE CODE	Grouping	DESCRIPTION
45		Wholesale and retail trade and repair of motor vehicles and motorcycles
	MVS	Sale of motor vehicles (45.1)
	MVRM	Maintenance of motor vehicles and sale of accessories (45.2 - 45.4)
47		Retail trade, except of motor vehicles and motorcycles
	FBT	Retail sale of Food, Beverages, Tobacco (47.1, 47.2, 47.8)
	FUEL	Retail sale of automotive fuel (47.3)
	OTHERS	Retail sale of other goods (47.4 - 47.7, 47.9)
TOTR		45 + 47

5. THE JOINT HARMONISED EU CONSTRUCTION SURVEY

5.1. Construction survey - Questionnaire

Monthly questions

Q1 How has your building activity developed over the past 3 months? It has...

- + increased
- = remain unchanged
- decreased

Q2 What main factors are currently limiting your building activity?

- none
- insufficient demand
- weather conditions
- shortage of labour force
- shortage of material and/or equipment
- financial constraints
- other factors

Q3 Do you consider your current overall order books to be...?

- + more than sufficient (above normal)
- = sufficient (normal for the season)
- not sufficient (below normal)

Q4 How do you expect your firm's total employment to change over the next 3 months? It will...

- + increase
- = remain unchanged
- decrease

Q41 The future development of your business situation is currently

- ++ easy to predict
- + moderately easy to predict
- moderately difficult to predict
- difficult to predict

Q5 How do you expect the prices you charge to change over the next 3 months?
They will...

- + increase
- = remain unchanged
- decrease

Quarterly question (January, April, July and October)

Q6 Assuming normal working hours, about how many months' work is accounted for by the work in hand and the work already contracted for?
Number of months: □□.□

5.2. Construction survey - Classification of sectors (NACE Rev. 2)

NACE CODE	DESCRIPTION
41	Construction of buildings
42	Civil engineering
43	Specialised construction activities
TOTF	Total construction

6. THE EU FINANCIAL SERVICES SURVEY (*DISCONTINUED IN APRIL 2023*)

6.1. Financial services sector survey - Questionnaire

Monthly questions

- Q1** How has your business situation developed over the past 3 months? It has...
- + improved
 - = remained unchanged
 - deteriorated
- Q2** How has demand (turnover) for your company's services changed over the past 3 months? It has...
- + increased
 - = remained unchanged
 - decreased
- Q3** How do you expect the demand (turnover) for your company's services to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease
- Q4** How has your firm's total employment changed over the past 3 months? It has...
- + increased
 - = remained unchanged
 - decreased
- Q5** How do you expect your firm's total employment to change over the next 3 months? It will...
- + increase
 - = remain unchanged
 - decrease

Quarterly questions (January, April, July and October)

Q10 How has your operating income developed over the last 3 months? It has...

- + increased
- = remained unchanged
- decreased

Q20 How do you expect your operating income to develop over the next 3 months?
It will...

- + increase
- = remain unchanged
- decrease

Q30 How have your operating expenses developed over the last 3 months? They have...

- + increased
- = remained unchanged
- decreased

Q40 How do you expect your operating expenses to develop over the next 3 months?
They will...

- + increase
- = remain unchanged
- decrease

Q50 How has the profitability of your company developed over the last 3 months? It has...

- + increased
- = remained unchanged
- decreased

Q60 How do you expect the profitability of your company to develop over the next 3 months? It will...

- + improve
- = remain unchanged
- deteriorate

Q70 How has your capital expenditure developed over the last 3 months? It has...

- + increased
- = remained unchanged
- decreased

Q80 How do you expect your capital expenditure to develop over the next 3 months?
It will...

- + increase
- = remain unchanged
- decrease

How has the competitive position of your company developed over the past 3 months?
It has...

- Q90** Total + improved / = remained unchanged / - deteriorated
Q91 In your country + improved / = remained unchanged / - deteriorated
