# Trends in earnings and wage dispersion: <br> The role of hours worked 

Cecilia García Peñalosa<br>Aix-Marseille School of Economics<br>Annual Research Conference, November 20, 2017<br>Fostering inclusive growth:<br>Inequality and fairness in integrated markets

## Earnings inequality: D9/D1 ratio

## Average hours worked

## Hours worked and earnings inequality

## Hours worked and earnings inequality

- Hardly any work relating hours worked and inequality
- Bell and Freeman 2001
- The increase in inequality within occupations has created incentives for individuals to work more hours
- Bowles and Park, 2005

## Hours worked and earnings inequality

## This talk

- Recent work joint with Daniele Checchi and Lara Vivian
- Are there differences in the distribution of hours?
- What do these differences imply for earnings?
- Can we say something about their causes?

## The distribution of hours of work

$\square U S \square U K \square D E \square F R$

## Time trends: inequality in hours worked

Hours Inequality

## Decomposing earnings inequality

- Use decomposable measure of inequality: Mean Log Deviation (MLD)
- Absolute contribution

$$
I_{y}=I_{w}+I_{h}+\text { CorTerm }_{w h}
$$

- Relative contribution

$$
1=\frac{I_{w}}{I_{y}}+\frac{I_{h}}{I_{y}}+\frac{\text { CorTerm }_{w h}}{I_{y}}
$$

- Impact of hours worked depends on hours inequality and the correlation between hours and wages
- Negative correlation - hours are equalizing
- Positive correlation - hours are unequalizing

## Contribution to changes in inequality

## Contribution to changes in inequality

- Iw ${ }^{-1 h}$ Incorr

## Contribution to changes in inequality

| Country | year | ly | Iw | lh | corr |
| ---: | ---: | ---: | ---: | ---: | ---: |
| US | 1995 | 0.225 | 0.165 | 0.039 | 0.021 |
|  | 2012 | 0.247 | 0.183 | 0.037 | 0.027 |
|  | $\Delta \%$ | 9.78 |  |  |  |
|  | $\delta$ |  | 0.81 | -0.09 | 0.27 |
| UK | 1995 | 0.260 | 0.136 | 0.091 | 0.033 |
|  | 2012 | 0.248 | 0.147 | 0.073 | 0.028 |
|  | $\Delta \%$ | -4.61 |  |  |  |
|  | $\delta$ |  | 0.91 | -1.5 | -0.42 |
| DE | 1995 | 0.147 | 0.103 | 0.060 | -0.016 |
|  | 2012 | 0.229 | 0.122 | 0.077 | 0.030 |
|  | $\Delta \%$ | 55.78 |  |  |  |
|  | $\delta$ |  | 0.23 | 0.21 | 0.56 |
| FR | 1995 | 0.133 | 0.101 | 0.040 | -0.008 |
|  | 2012 | 0.137 | 0.086 | 0.042 | 0.010 |
|  | $\Delta \%$ | 3 |  |  |  |
|  | $\delta$ |  | -3.75 | 0.5 | 4.5 |

Average hours by quintile of the wage distribution

- top 20\% - bottom 20\%

## What about zero hours?

| Gini coefficient of <br> earnings |  | Employed |
| ---: | :---: | :---: |
| France | Entire population |  |
|  | 2000 | 0.131 |
| Germany |  |  |
|  | 2012 | 0.137 |
| 200 | 0.185 | 0.533 |
| 2012 | 0.229 |  |

## Correlation and elasticity of hours w.r.t. wages

## What is behind the change in the elasticity?

- Employment polarization - Goos et al. 2009
- Occupational inequality - Bell and Freeman 2001
- Rise of the service economy - Ngay and Petrongolo 2017

## Change in hours worked: <br> Decomposition by skill and gender

Occ polarization Hour changes within occ

## Elasticity of hours w.r.t. wages: Selected occupations

$$
-U S=U K=D E=F R
$$

## Conclusions

- Hours inequality has moved from having an equalizing effect to having an unequalising one
- Need to understand what determines hours worked
- Are a low hours chosen?
- Are they a characteristic of certain jobs?
- Importance of change in the h-w correlation
- Caveat - are low hours always bad for equality? German case

## Additional tables and figures

## Time trends: average hours worked

Average Hours Worked

## Contribution to changes in earnings inequality

## Unions and inequality

Correlation Term VS Union Density - US $=U K=D E=F R$
